THE SPECIFICATIONS AND INFORMATION REGARDING THE PRODUCTS IN THIS MANUAL ARE SUBJECT TO CHANGE WITHOUT NOTICE. ALL STATEMENTS, INFORMATION, AND RECOMMENDATIONS IN THIS MANUAL ARE BELIEVED TO BE ACCURATE BUT ARE PRESENTED WITHOUT WARRANTY OF ANY KIND, EXPRESS OR IMPLIED. USERS MUST TAKE FULL RESPONSIBILITY FOR THEIR APPLICATION OF ANY PRODUCTS.

THE SOFTWARE LICENSE AND LIMITED WARRANTY FOR THE ACCOMPANYING PRODUCT ARE SET FORTH IN THE INFORMATION PACKET THAT SHIPPED WITH THE PRODUCT AND ARE INCORPORATED HEREIN BY THIS REFERENCE. IF YOU ARE UNABLE TO LOCATE THE SOFTWARE LICENSE OR LIMITED WARRANTY, CONTACT YOUR CISCO REPRESENTATIVE FOR A COPY.

The Cisco implementation of TCP header compression is an adaptation of a program developed by the University of California, Berkeley (UCB) as part of UCBs public domain version of the UNIX operating system. All rights reserved. Copyright 1981, Regents of the University of California.

NOTWITHSTANDING ANY OTHER WARRANTY HEREIN, ALL DOCUMENT FILES AND SOFTWARE OF THESE SUPPLIERS ARE PROVIDED "AS IS" WITH ALL FAULTS. CISCO AND THE ABOVE-NAMED SUPPLIERS DISCLAIM ALL WARRANTIES, EXPRESSED OR IMPLIED, INCLUDING, WITHOUT LIMITATION, THOSE OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE AND NONINFRINGEMENT OR ARISING FROM A COURSE OF DEALING, USAGE, OR TRADE PRACTICE.

IN NO EVENT SHALL CISCO OR ITS SUPPLIERS BE LIABLE FOR ANY INDIRECT, SPECIAL, CONSEQUENTIAL, OR INCIDENTAL DAMAGES, INCLUDING, WITHOUT LIMITATION, LOST PROFITS OR LOSS OR DAMAGE TO DATA ARISING OUT OF THE USE OR INABILITY TO USE THIS MANUAL, EVEN IF CISCO OR ITS SUPPLIERS HAVE BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

Any Internet Protocol (IP) addresses and phone numbers used in this document are not intended to be actual addresses and phone numbers. Any examples, command display output, network topology diagrams, and other figures included in the document are shown for illustrative purposes only. Any use of actual IP addresses or phone numbers in illustrative content is unintentional and coincidental.

Cisco and the Cisco logo are trademarks or registered trademarks of Cisco and/or its affiliates in the U.S. and other countries. To view a list of Cisco trademarks, go to <http://www.cisco.com/go/trademarks>. Third-party trademarks mentioned are the property of their respective owners. The use of the word partner does not imply a partnership relationship between Cisco and any other company. (1110R)

Member Function Documentation	90
Activities Class Reference.....	92
Public Member Functions.....	92
Detailed Description	92
Activities Schema.....	92
Member Function Documentation	92
Activity Class Reference	94
Public Member Functions.....	94
Detailed Description	95
Activity Schema	95
Member Function Documentation	96
Activity Class Reference	103
Public Member Functions.....	103
Detailed Description	104
Activity Schema	104
Member Function Documentation	105
ActivityAttachmentDetailsExamples Class Reference.....	112
Detailed Description	112
Examples for Get Activity Attachment Details	112
Example 1 - Get details of an attachment	112
Example 2 - Get contentUrl along with details for an attachment.....	113
Example 3 - Get all attributes along with details for an attachment	115
ActivityAttachmentListExamples Class Reference.....	117
Detailed Description	117
Examples for Get Activity Attachments	117
Example 1 - Get all attachments for an activity.....	117
ActivityByIDsExamples Class Reference	119
Detailed Description	119
Examples for GET Activities by IDs.....	119
Example 1 - Get all attributes for an email activity	119
Example 2 - Get all attributes for a chat activity	123
Example 5 - Get all attributes for a web activity	127
Example 6 - Get an additional attribute for multiple activities sorted on department name.....	130
Example 7 - Get an additional custom attribute for a single activity	134
Example 8 - Get summary attributes and payload for activities of all types.....	137
ActivityChangeCaseExamples Class Reference.....	142
Detailed Description	142
Examples for changing case of activities.....	142
Example 1 - Change case of an activity to a new case without optional attributes.....	142
Example 2 - Change case of an activity to an existing case.....	143
Example 3 - Change case of multiple activities to an existing case.....	144
Example 4 - Change case of multiple activities to a new case by providing all case attributes.....	146
ActivityChangeCustomerExamples Class Reference	148
Detailed Description	148

Examples for changing customer of activities	148
Example 1 - Change customer of an activity	148
Example 2 - Change customer of multiple activities using different contact points.....	149
Example 3 - Change customer of multiple activities	151
ActivityCommonInfoPage Class Reference	153
Detailed Description	153
Supported values of some Common Query Parameters that appear in Activity Resource APIs	153
Values of \$attribute common parameter supported by Activity Resource	153
Values of \$sort common parameter supported by Activity Resource.....	154
Summary attributes of Activity Resource.....	154
Activity summary	154
ActivityCommonInfoPage Class Reference	156
Detailed Description	156
Supported values of some Common Query Parameters that appear in Activity Resource APIs	156
Values of \$attribute common parameter supported by Activity Resource	156
Values of \$sort common parameter supported by Activity Resource.....	157
Summary attributes of Activity Resource.....	157
Activity summary	157
ActivityExampleHeadersPostSection Class Reference	159
Detailed Description	159
ActivitySearchExamples Class Reference.....	160
Detailed Description	160
Examples for Activity Search.....	160
Example 1 - Search for activities by customer	160
Example 2 - Search for activities by case with pagination parameters	164
Example 3 - Search for activities by custom attribute with range parameters	168
Example 4 - Search for activities by status and last modified date.....	171
Example 5 - Search for activities by assigned user with sorting on last modified date	173
Example 6 - Search for activities by queue and when created date	178
Example 7 - Search for activities by mode and last modified date	182
Example 8 - Search for activities by status, assigned user name and last modified date.....	186
ActivitySearchPage Class Reference.....	189
Detailed Description	189
Activity Search	189
ActivitySearchSupportedStatusAndSubstatus Class Reference	193
Detailed Description	193
Supported Activity status and substatus values	193
Actor Class Reference	195
Public Member Functions.....	195
Detailed Description	195
Actor Schema	195
Member Function Documentation	196
Actor Class Reference	197
Public Member Functions.....	197
Detailed Description	197
Actor Schema	197
Member Function Documentation	198
Adapter Class Reference.....	199

Case Class Reference.....	304
Public Member Functions.....	304
Detailed Description.....	304
Case Schema.....	304
Member Function Documentation.....	305
CaseByIDsExamples Class Reference.....	311
Detailed Description.....	311
Examples for GET Cases by IDs.....	311
Example 1 - Get summary attributes for a single case.....	311
Example 2 - Get all attributes for a single case.....	313
Example 3 - Get summary attributes and additional attributes for multiple cases.....	315
Example 4 - Get multiple cases sorted on department.....	318
Example 5 - Get multiple cases sorted on customer name.....	320
CaseCommonInfoPage Class Reference.....	323
Detailed Description.....	323
Supported values of some Common Query Parameters that appear in Case Resource APIs.....	323
Values of \$attribute common parameter supported by Case Resource.....	323

Values of \$sort common parameter supported by Case Resource	323
Summary attributes of Case Resource	324
Case summary.....	324
CaseCommonInfoPage Class Reference	325
Detailed Description	325
Supported values of some Common Query Parameters that appear in Case Resource APIs.....	325
Values of \$attribute common parameter supported by Case Resource.....	325
Values of \$sort common parameter supported by Case Resource	325
Summary attributes of Case Resource	326
Case summary.....	326
Cases Class Reference	327
Public Member Functions.....	327
Detailed Description	327
Cases Schema	327
Member Function Documentation	327
Cases Class Reference	329
Public Member Functions.....	329
Detailed Description	329
Cases Schema	329
Member Function Documentation	329
CaseSearchExamples Class Reference	331
Detailed Description	331
Examples for Case Search	331
Example 1 - Search for cases by customer with summary attributes in response.....	331
Example 2 - Search for cases by status and custom attribute, with range parameters	333
Example 3 - Search for cases by multiple attributes with pagination parameters.....	336
CaseSearchPage Class Reference	340
Detailed Description	340
Case Search	340
Category Class Reference	344
Public Member Functions.....	344
Detailed Description	344
Category Schema.....	344
Member Function Documentation	344
Category Class Reference.....	346
Public Member Functions.....	346
Detailed Description	346
Category Schema.....	346
Member Function Documentation	346
ChangeCustomerForCaseExamples Class Reference.....	348
Detailed Description	348
Examples for change customer of a case	348
Example 1 - Change customer of a case	348
ChangeCustomerForCasePage Class Reference.....	350
Detailed Description	350
Change Customer for Case	350
Overview	350
Permissions.....	350
ChannelConfiguration Class Reference.....	354
Public Member Functions.....	354
Detailed Description	354
Member Function Documentation	354
ChatAttributes Class Reference	357
Public Member Functions.....	357
Detailed Description	357
ChatAttributes Schema	357

Member Function Documentation	358
ChatAttributes Class Reference	360
Public Member Functions	360
Detailed Description	360
ChatAttributes Schema	360
Member Function Documentation	361
ChatConference Class Reference.....	363
Public Member Functions.....	363

ClientInfo Class Reference	375
Public Member Functions.....	375
Detailed Description	375
ClientInfo Schema	375
Member Function Documentation	375
CloseCaseExamples Class Reference.....	377
Detailed Description	377
Examples for close case.....	377
Example 1 - Close a case	377
CloseCasePage Class Reference	379
Detailed Description	379
Close Case	379
Overview	379
Permissions.....	379
CommonParametersPage Class Reference	382
Detailed Description	382
Supported Common Query Parameters in ECE REST API.....	382
CompleteActivityExamples Class Reference	385
Detailed Description	385
Examples for completing activities.....	385
Example 1 - Complete activities of multiple cases	385

Example 2 - Complete single activity resulting in case getting closed	387
Example 3 - Complete single activity without a case	388
ComposeAndSaveEmailExamples Class Reference.....	391
Detailed Description	391
Examples for compose and save email activity	391
Example 1 - Compose email for an existing case with required elements, using XML/JSON as content-type..	391
Example 2 - Compose email for a new case with required elements, using Multipart/form-data as content-type	392
Example 3 - Compose an email with required elements and attachments, using XML/JSON as content-type ..	394
Example 4 - Compose an email for a new case with required elements, using Multipart/form-data as content-type	396
Example 5 - Composing an email for a new customer with all elements, using XML/JSON as content-type ..	398
Example 6 - Composing an email for a new customer with all elements, using Multipart/form-data as content-type	401
ComposeAndsendcompleteEmailExamples Class Reference.....	405
Detailed Description	405
Examples for compose and send-complete email activity	405
Example 1 - Compose email with macros for an existing case with required elements, using XML/JSON as content-type	405
Example 2 - Compose email with macros for a new case with required elements, using Multipart/form-data as content-type	407
Example 3 - Compose an email with required elements and attachments, using XML/JSON as content-type ..	408
Example 4 - Compose an email for a new case with required elements, using Multipart/form-data as content-type	410
Example 5 - Composing an email for a new customer with all elements, using XML/JSON as content-type ..	412
Example 6 - Composing an email for a new customer with all elements, using Multipart/form-data as content-type	415
ComposeAndsendEmailExamples Class Reference	420
Detailed Description	420
Examples for compose and send email activity	420
Example 1 - Compose email with macros for an existing case with required elements, using XML/JSON as content-type	420
Example 2 - Compose email with macros for a new case with required elements, using Multipart/form-data as content-type	422
Example 3 - Compose an email with required elements and attachments, using XML/JSON as content-type ..	423
Example 4 - Compose an email for a new case with required elements, using Multipart/form-data as content-type	425
Example 5 - Composing an email for a new customer with all elements, using XML/JSON as content-type ..	427
Example 6 - Composing an email for a new customer with all elements, using Multipart/form-data as content-type	430
CompositeRequest Class Reference	435
Public Member Functions.....	435

CreateContactPersonPage Class Reference	505
Detailed Description	505
Create Contact Person	505
CreateContactPointPage Class Reference.....	507
Detailed Description	507
Create Contact Point.....	507
CreateContextContactPointPage Class Reference.....	510
Detailed Description	510
Create Contact Point.....	510
CreateCorporateCustomerExamples Class Reference	512
Detailed Description	512
Examples for Create Corporate Customer	512

Example 1 - Create customer with required elements	512
Example 2 - Create customer with all elements.....	513
CreateCorporateCustomerPage Class Reference	521
Detailed Description	521
Create Corporate Customer	521
Permissions.....	521
Request	521
CreateCustomerGrantExamples Class Reference.....	525
Detailed Description	525
Examples for create grants on a customer	525
Example 1 - Provide grants to a single customer.....	525
Example 2 - Provide grants to multiple customers	526
CreateCustomerGrantPage Class Reference.....	529
Detailed Description	529
Create customer grants	529
Permissions.....	529
Request	530
Created Class Reference	533
Public Member Functions.....	533
Detailed Description	533
Member Function Documentation	533
CreateEmailActivityResponseExamples Class Reference.....	534
Detailed Description	534
Examples for Create Incoming Email Activity.....	534
Example 1 - Create a secure email response with required elements, using XML/JSON content-type.....	534
Example 2 - Create a secure email response with required elements, using Multipart/form-data content-type.....	535
Example 3 - Create a secure email response with inline and non-inline attachments, using XML/JSON content-type	537
Example 4 - Create a secure email response with inline and non-inline attachment, using Multipart/form-data content-type	540
Example 5 - Create a secure email response with all attributes, using XML/JSON content-type	542
Example 6 - Create a secure email response with all attributes, using Multipart/form-data content-type.....	544
Example 7 - Create secure email response with required elements for another customer, using XML/JSON content-type	546
Example 8 - Create secure email response for another customer with required elements, using Multipart/form-data content-type	548
Example 9 - Create secure email response by providing receiver email address, using XML/JSON content-type	549
Example 10 - Create secure email response by providing receiver email address, using Multipart/form-data content-type	551

Introduction

Overview

Getting Started With ECE REST API

Before you begin working with ECE API it is important to understand some of its key characteristics.

Stateless

ECE REST APIs are stateless. All the necessary information to process a request is contained in the request itself. No context information is stored on the server to process the request. Statelessness improves the API performance, and allows better scalability for the application.

Layered

The REST architecture of ECE APIs allows the existence of intermediaries such as gateways, proxies, or load balancers between the client and the server to facilitate improved scalability and to enforce security policies.

Support for XML and JSON

ECE REST API supports both XML and JSON as the data format for requests and responses. The default format is XML.

Use the HTTP header `Accept:application/json` to select JSON or `Accept:application/xml` to select XML.

Date and Time format

Date and time information in requests and responses follows the [ISO 8601](#) format.

Authentication

ECE REST API supports session based authentication. To learn more about authentication refer [Understanding Authentication](#).

Compression

In order to improve performance, ECE API allows the use of compression on responses.

Response Compression

You can request compression on the responses by using the HTTP header *Accept-Encoding: gzip* in a request. The response is compressed if a client specifies this header in the request, and the response includes HTTP header *Content-Encoding: gzip* to indicate response compression

Request Compression

Compressing of requests is not supported at this time.

Optimized Responses

ECE API responses are optimized to minimize the network traffic. As a result, the response includes only a pre-defined set of attributes; the other parts of the resource are not included in the response unless explicitly requested. You can request additional attributes of a resource by using the **\$attribute** query parameter.

Use the `$attribute` query parameter to specify a comma-separated list of additional attributes that you want in the response. For example, appending `$attributes=keywords,summary` to an Article URI's request will result in inclusion of `keywords` and `summary` for the requested article. You can also use `$attributes=all`, a special construct, to request all the attributes of a resource.

Support for CORS

ECE REST API supports Cross-origin resource sharing (CORS). CORS is a mechanism that allows resources (e.g. fonts, JavaScript, etc.) on a web page to be requested from another domain outside the domain from which the resource originated.

You can configure a whitelist of the origins for ECE REST API from the ECE Administration Console.

Scope of the API

The API currently covers the following areas:

Login and Logout APIs:

- Login
- Logout
- [Login Customer](#)
- [Logout Customer](#)

- Login Customer using Single Sign-On:
 - [Single Sign-On using SAML](#)
 - [Single Sign-On using SAML bearer token](#)
-

Interaction:

- Cases:
 - [Get custom attributes for case resource](#)
 - [Get cases by IDs](#)
 - [Search for cases](#)

- [Edit case](#)
- [Change customer for case](#)
- [Close case](#)
-
- Activities:
 - [Get activities by IDs](#)
 - [Search for activities](#)
 - [Get attachments of an activity](#)
 - [Download an activity attachment](#)
 - [Change Customer of Activities](#)
 - [Compose and Save Email Activity](#)
 - [Create Incoming Email Activity](#)
 - [Compose and send email activity](#)
 - [Compose and send-complete email activity](#)
 - [Edit Activity](#)
 - [Pull activities from queues](#)
 - [Pick Activities from users and queues](#)
 - [Transfer Activities to User](#)
 - [Transfer Activities to Queue](#)
 - [Transfer Activities to Department](#)
 - [Change Case of Activities](#)
 - [Complete Activities](#)
-
- Customers:
 - [Get attributes for customer resource](#)
 - [Get customers by IDs](#)
 - [Search for customers](#)
 - [Create Individual Customer](#)
 - [Create Group Customer](#)
 - [Create Corporate Customer](#)
 - [Edit Individual Customer](#)
 - [Edit Group Customer](#)
 - [Edit Corporate Customer](#)
 - [Create customer grants](#)
 - [Get customer grants](#)
 - [Delete customer grants](#)
-

Customer Portal APIs:

- Cases:
 - [Get case by ID](#)
 - [Search for cases](#)
-
- Activities:
 - [Get activity by ID](#)
 - [Search for activities](#)
 - [Get details for all attachments of an activity](#)
 - [Get attachment details](#)
 - [Create incoming email activity](#)
 - [Create an email response](#)
 - [Mark activities as read](#)

- [Mark activities as unread](#)
- [Hide activities](#)
- [Get issue types for a message center](#)
-
- Customers:
 - [Get customer profile](#)
 - [Edit customer profile](#)
 - [Get customer grants](#)
-

Understanding Authentication

Session Life Cycle

Handling a 401 Response

For Interaction APIs:

```
<?xml version="1.0" encoding="UTF-8" standalone="yes" ?><error
xmlns="http://bindings.egain.com/ws/model/v12/gen/common"> <code>401-101</code>
<developerMessage>Invalid or expired 'X-egain-session' header provided. New login is
required.</developerMessage></error>
```

If 401 response is received from the server, the client should call Login API with valid user credentials.

Using ECE REST APIs From ECE Application Consoles

Starting with ECE 11.6, when a user logs into ECE application consoles and is successfully authenticated, the user is automatically logged in to make calls to the interaction and authoring REST APIs. If the user logs out from ECE console, she will be automatically logged out for that session from ECE REST API.

Upon successful authentication to ECE console, a session cookie containing the user's session identifier is created and set on the user's web browser. The name of this session cookie is `X-egain-session`. In addition, a token to prevent Cross-Site Request Forgery (CSRF) attacks is also created by the server. The name of this token is `X-egain-csrf`. The same session identifier and the anti-CSRF token can be used for making calls to ECE REST APIs.

In order to make REST API calls seamlessly from ECE application console, you need to pass the session identifier (`X-egain-session`) as well as anti-CSRF token (`X-egain-csrf`) with every API request.

- `X-egain-session` needs to be sent in as a cookie. The cookie is sent automatically by the browser if the call is made from the same browser session.
- `X-egain-csrf` needs to be sent in as a header. You need to explicitly send the `X-egain-csrf` header with the request. For your convenience, a utility JavaScript function `getEgainSecurityToken` has been provided to retrieve the value of this token. See [my_activities.html](#) file for details on how to use this function.

Example:

1. Copy [my_activities.html](#) file on your ECE application installation's web server in `ECE_INSTALLATION_FOLDER/web/custom/view` folder.
2. Login as a partition administrator, and add a new custom Information pane from the Tools Console. Set the launch URL to: http://WEB_SERVER_ADDRESS/CONTEXT_ROOT/web/custom/view/my_activities.html.
3. Login to the Agent Console.
4. Go to the My Activities section of the Information pane. When this section loads, it will make an AJAX request to ECE REST API with `X-egain-csrf` request header, and browser automatically will send the

X-egain-session cookie. This AJAX request makes a GET Activity API call to fetch all activities for the logged in user. Response is rendered in the Information pane.

In this example the following AJAX code snippet calls an ECE REST API using jQuery. Note that the X-egain-csrf request header sent in the request contains anti-CSRF token.

```
$(document).ready(function(){ $.ajax({
url:"../../../../ws/v12/interaction/activity?assignedTo=" + userId,          type:'GET',
headers: {'X-egain-csrf':eGainCSRFToken,          'Accept-Language':'en-US',
'Accept':'application/json'},          complete:function(xhr, status){          if
(status=='success' && xhr.status=='200')          {          // Code to render the response
}          }          });});
```

Understanding Common Query Parameters

Supported Common Query Parameters in ECE REST API

In addition to API specific query parameters, ECE REST API define query parameters that are applicable to sets of APIs and are not closely related to the function of any API. Such parameters are referred to as "*common query parameters*" or simply "*common parameters*" in this documentation. Common parameters always start with '\$' (dollar sign) symbol.

This page describes all the *common query parameters* that may appear in ECE REST APIs. While this is a comprehensive list of common parameters that are currently in use, each API may choose from below list which parameters to support.

All *common query parameters* are **optional** query parameters unless stated otherwise in a specific API documentation.

Name	Description	Default value	Allowed Values
\$pagenum	<i>Pagination</i> parameter that specifies the page number of results to be returned. Used in conjunction with \$pagesize.	1	A positive integer
\$pagesize	<i>Pagination</i> parameter that specifies the number of results per page. Used in conjunction with \$pagenum.	25	An integer between 1 and 75
\$rangestart	<i>Range</i> parameter that specifies the starting index of the range of results to be returned. Used in conjunction with \$rangesize.	1	A positive integer
\$rangesize	<i>Range</i> parameter that specifies the number (range) of results to be returned. Used in conjunction with \$rangestart.	25	An integer between 1 and 75
\$sort	Indicates the resource attribute name on which the results must be sorted. Only a single attribute	N/A	Each API that supports sorting, has its own set of allowed values

	name is allowed; comma separated values are not supported.		
\$order	Indicates the sorting order. Must be accompanied by \$sort.	'asc '	'asc ' and 'desc '
\$lang	Mostly used in Authoring APIs to specify the language of requested Authoring resource, like article, folder, topic etc.	Default user language	supported-dollar-lang-values
\$level	If the requested resource represents a hierarchical structure (e.g., folders), \$level may be used to indicate the depth of hierarchy (starting from root node) up to which the results should be returned.	0	<ul style="list-style-type: none"> • 0 (only root node is returned) • a positive integer (the actual level of depth) • -1 (entire hierarchy is expanded)
\$count	If this parameter is provided, only the total number of items qualifying the request will be returned, along with the link to the first page of the items. The actual items will not be returned.	'N/A '	'yes '
\$attribute	A comma separated list of attribute names to be returned in resource representation in addition to summary attributes.	N/A	<ul style="list-style-type: none"> • all (all available attributes are returned) • Additionally, each API that supports \$attribute, has its own set of allowed values

NOTE : *Pagination* and *Range* parameters cannot be used together in the same request and will result in **400 - Bad Request** server response.

Troubleshooting

For Interaction APIs:

```
<?xml version="1.0" encoding="UTF-8" standalone="yes" ?><error  
xmlns="http://bindings.egain.com/ws/model/v12/gen/common"> <code>400-124</code>  
<developerMessage>$order query parameter must be accompanied by $sort.</developerMessage></error>
```

REST API Index

Login and Logout APIs

Login

Method	APIs	Description
POST	kb-login-page	Logs-in the user and creates a new session.

Logout

Method	APIs	Description
DELETE	kb-logout-page	Logs-out an user and terminates the user session.

Login Customer

Method	APIs	Description
POST	Login Customer	Logs-in the customer and creates a new session.

Logout Customer

Method	APIs	Description
POST	Logout Customer	Logs-out a customer and terminates the customer session.

Login Customer using Single Sign-On

Single Sign-On using SAML

Method	APIs	Description
POST	Single Sign-On using SAML	Logs-in customer using Single Sign-On using SAML.

Single Sign-On using SAML bearer token

Method	APIs	Description
--------	------	-------------

POST	Single Sign-On using SAML bearer token	Logs-in the customer using Single Sign-On using SAML bearer token.
------	--	--

Interaction APIs

Case APIs

Get case attributes

Method	APIs	Description
GET	Get Case Attributes	Get custom attributes for case resource

Get cases by IDs

Method	APIs	Description
GET	Get Cases by IDs	Get cases by IDs

Search for cases

Method	APIs	Description
GET	Case Search	Search for cases

Edit case

Method	APIs	Description
PUT	Edit Case	Edit case

Change customer for case

Method	APIs	Description
PUT	Change Customer for Case	Change customer for case

Close case

Method	APIs	Description
--------	------	-------------

PUT	Close Case	Close case
-----	----------------------------	------------

Customer APIs

Get customer attributes

Method	APIs	Description
GET	Get Customer Attributes	Get attributes for customer resource like type, country, industry, level, contactPersons, and custom attributes.

Get customers by IDs

Method	APIs	Description
GET	Get Customers by IDs	Get customers by IDs

Search for customers

Method	APIs	Description
GET	Customer Search	Search for customers

Create individual customer

Method	APIs	Description
POST	Create Individual Customer	Create individual customer

Create group customer

Method	APIs	Description
POST	Create Group Customer	Create group customer

Create corporate customer

Method	APIs	Description
POST	Create Corporate Customer	Create corporate customer

Edit individual customer

Method	APIs	Description
PUT	Edit Individual Customer	Edit individual customer

Edit group customer

Method	APIs	Description
PUT	Edit Group Customer	Edit group customer

Edit corporate customer

Method	APIs	Description
PUT	Edit Corporate Customer	Edit corporate customer

Create customer grants

Method	APIs	Description
POST	Create customer grants	Create grant on a customer

Get customer grants

Method	APIs	Description
GET	Get customer grants	Get grants of a customer

Delete customer grants

Method	APIs	Description
DELETE	Delete customer grants	Delete grants provided by a customer

Activity APIs

Get activities by IDs

Method	APIs	Description
GET	Get Activities by IDs	Get activities by IDs

Search for activities

Method	APIs	Description
GET	Activity Search	Search for activities

Get activity attachments

Method	APIs	Description
GET	Get Activity Attachments	Get details for all attachments of an activity

Get attachment details

Method	APIs	Description
GET	Get Attachment Details	Get details of an activity attachment including content URL

Change customer of activities

Method	APIs	Description
PUT	Change Customer of Activities	Change customer of activities

Compose and save email activity

Method	APIs	Description
POST	Compose and Save Email Activity	Compose and save email activity

Create incoming email activity

Method	APIs	Description
POST	Create Incoming Email Activity	Create incoming email activity

Compose and send email activity

Method	APIs	Description
POST	Compose and send email activity	Compose and send email activity

Compose and send-complete email activity

Method	APIs	Description
POST	Compose and send-complete email activity	Compose and send-complete email activity

Edit activity

Method	APIs	Description
PUT	Edit Activity	Edit Activity

Pull activities

Method	APIs	Description
PUT	Pull Activities	Pull activities from queues

Pick activities

Method	APIs	Description
PUT	Pick Activities	Pick activities from users and queues

Transfer activities to user

Method	APIs	Description
PUT	Transfer Activities to User	Transfer activities to user

ACL Class Reference

Public Member Functions

- [ACLEntries](#) [getEntries](#) ()
 - [Link](#) [getLink](#) ()
 - void [setEntries](#) ([ACLEntries](#) value)
 - void [setLink](#) ([Link](#) value)
-

Detailed Description

ACL Schema

This schema contains [ACL](#) type details.

XML Schema File

model/v12/xsd/kb/folder.xsd

Name	Description	Type
link	Self link to ACL	Link
entries	Entries for the Access Control List for the folder	ACLEntries

Member Function Documentation

[ACLEntries](#) [getEntries](#) ()

Gets the value of the entries property.

Returns:

possible object is [ACLEntries](#)

[Link](#) [getLink](#) ()

Gets the value of the link property.

Returns:

possible object is [Link](#)

void [setEntries](#) ([ACLEntries](#) value)

Sets the value of the entries property.

Parameters:

value	allowed object is ACLEntries
-------	--

void setLink ([Link](#) value)

Sets the value of the link property.

Parameters:

<i>value</i>	allowed object is Link
--------------	--

ACLEntries Class Reference

Detailed Description

ACL Entries Schema

This schema contains [ACLEntries](#) type details.

XML Schema File

model/v12/xsd/kb/folder.xsd

Name	Description	Type
link	Self link to ACL Entries	Link
paginationInfo	Pagination details of ACL	PaginationInfo
entry	Array of the ACL Entries for the folder	ACLEntry
count	Total count of ACL Entries	Int

Member Function Documentation

int getCount ()

Gets the value of the count property.

Returns:

possible object is [Integer](#)

java.util.List<[ACLEntry](#)> getEntry ()

Gets the value of the entry property.

This accessor method returns a reference to the live list, not a snapshot. Therefore any modification you make to the returned list will be present inside the JAXB object. This is why there is not a `set` method for the entry property.

For example, to add a new item, do as follows:

```
getEntry().add(newItem);
```

Objects of the following type(s) are allowed in the list [ACLEntry](#)

[Link](#) getLink ()

Gets the value of the link property.

Returns:

possible object is [Link](#)

[PaginationInfo](#) getPaginationInfo ()

Gets the value of the paginationInfo property.

Returns:

possible object is [PaginationInfo](#)

void setCount (int *value*)

Sets the value of the count property.

Parameters:

<i>value</i>	allowed object is Integer
--------------	---

void setLink ([Link](#) *value*)

Sets the value of the link property.

Parameters:

<i>value</i>	allowed object is Link
--------------	--

void setPaginationInfo ([PaginationInfo](#) *value*)

Sets the value of the paginationInfo property.

Parameters:

<i>value</i>	allowed object is PaginationInfo
--------------	--

 - [User](#) [getUser](#) ()
 - void [setGroup](#) ([User](#) value)
 - void [setPropagate](#) (java.lang.String value)
 - void [setUser](#) ([User](#) value)
-

Detailed Description

ACL Entry Schema

This schema contains [ACLEntry](#) type details.

XML Schema File

model/v12/xsd/kb/folder.xsd

Name	Description	Type
user	User who belongs to the ACL	User
group	User-Group which belongs to the ACL	Group
permission	ACL for the corresponding user/group on the folder	ACLPermission
propagate	Denotes, whether, the ACL permissions should be propagated and applied to the child folders. Allowed values are <ul style="list-style-type: none">• true• false	String

Member Function Documentation

[User](#) [getGroup](#) ()

Gets the value of the group property.

Returns:

possible object is [User](#)

java.util.List<[ACLPermission](#)> [getPermission](#) ()

Gets the value of the permission property.

This accessor method returns a reference to the live list, not a snapshot. Therefore any modification you make to the returned list will be present inside the JAXB object. This is why there is not a `set` method for the permission property.

For example, to add a new item, do as follows:

```
getPermission().add(newItem);
```

Objects of the following type(s) are allowed in the list [ACLPermission](#)

java.lang.String getPropagate ()

Gets the value of the propagate property.

Returns:

possible object is [java.lang.String](#)

[User](#) getUser ()

Gets the value of the user property.

Returns:

possible object is [User](#)

void setGroup ([User](#) value)

Sets the value of the group property.

Parameters:

<i>value</i>	allowed object is User
--------------	--

void setPropagate (java.lang.String value)

Sets the value of the propagate property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setUser ([User](#) value)

Sets the value of the user property.

Parameters:

<i>value</i>	allowed object is User
--------------	--

ACLPermission Class Reference

Public Member Functions

- int [getExplicit](#) ()
 - [PermissionTypes](#) [getValue](#) ()
 - void [setExplicit](#) (int value)
 - void [setValue](#) ([PermissionTypes](#) value)
-

Detailed Description

ACL Permission Schema

This schema contains [ACLPermission](#) type details.

XML Schema File

model/v12/xsd/kb/folder.xsd

Name	Description	Type
permission	Denotes the type of permission. Following are the allowed values <ul style="list-style-type: none">• create_folder• delete_folder• edit_folder• own_folder• suggest_article• view_folder• create_article• edit_article• delete_article• manage_suggestions	String
explicit	Denotes, whether, this permission type is explicit or not. Allowed values: <ul style="list-style-type: none">• 0 - false• 1 - true	Int

Member Function Documentation

int [getExplicit](#) ()

Gets the value of the explicit property.

Returns:

possible object is [Integer](#)

[PermissionTypes](#) getValue ()

Gets the value of the value property.

Returns:

possible object is [PermissionTypes](#)

void setExplicit (int *value*)

Sets the value of the explicit property.

Parameters:

<i>value</i>	allowed object is Integer
--------------	---

void setValue ([PermissionTypes](#) *value*)

Sets the value of the value property.

Parameters:

<i>value</i>	allowed object is PermissionTypes
--------------	---

Actions Class Reference

Public Member Functions

- Actions.On [getOn](#) ()
 - java.lang.String [getType](#) ()
 - XMLGregorianCalendar [getWhen](#) ()
 - void [setOn](#) (Actions.On value)
 - void [setType](#) (java.lang.String value)
 - void [setWhen](#) (XMLGregorianCalendar value)
-

Detailed Description

WebAttributes Schema

This schema has the definition of [Actions](#) of a web activity.

XML Schema File

model/v12/xsd/interaction/activity.xsd

Name	Description	Type
type	This provides the information about the type of the user action.	String
when	This provides information about when the action was performed.	DataAndTime
on	This provides information about what was acted upon. The information about that acted object would be provided through following elements: <ul style="list-style-type: none">• id: Id of the object, if applicable.• name: Name of the object.	<ul style="list-style-type: none">• Long• String

Member Function Documentation

Actions.On [getOn](#) ()

Gets the value of the on property.

Returns:

possible object is [Actions.On](#)

java.lang.String getType ()

Gets the value of the type property.

Returns:

possible object is [java.lang.String](#)

XMLGregorianCalendar getWhen ()

Gets the value of the when property.

Returns:

possible object is [java.lang.String](#)

void setOn (Actions.On value)

Sets the value of the on property.

Parameters:

<i>value</i>	allowed object is Actions.On
--------------	--

void setType (java.lang.String value)

Sets the value of the type property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setWhen (XMLGregorianCalendar value)

Sets the value of the when property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

Detailed Description

WebAttributes Schema

This schema has the definition of [Actions](#) of a web activity.

XML Schema File

model/v15/xsd/interaction/activity.xsd

Name	Description	Type
type	This provides the information about the type of the user action.	String
when	This provides information about when the action was performed.	DataAndTime
on	This provides information about what was acted upon. The information about that acted object would be provided through following elements: <ul style="list-style-type: none">• id: Id of the object, if applicable.• name: Name of the object.	<ul style="list-style-type: none">• Long• String

Member Function Documentation

Actions.On [getOn](#) ()

Gets the value of the on property.

Returns:

possible object is [Actions.On](#)

java.lang.String getType ()

Gets the value of the type property.

Returns:

possible object is [java.lang.String](#)

XMLGregorianCalendar getWhen ()

Gets the value of the when property.

Returns:

possible object is [java.lang.String](#)

void setOn (Actions.On value)

Sets the value of the on property.

Parameters:

<i>value</i>	allowed object is Actions.On
--------------	--

void setType (java.lang.String value)

Sets the value of the type property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setWhen (XMLGregorianCalendar value)

Sets the value of the when property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

Detailed Description

Activities Schema

This schema contains [Activities](#) details.

XML Schema File

model/v12/xsd/interaction/activity.xsd

Name	Description	Type
link	self link	Link
activity	Can have multiple activity elements. holding details of the activity	Activity
paginationInfo	Pagination details of activities	PaginationInfo

Member Function Documentation

java.util.List<[Activity](#)> [getActivity](#) ()

Gets the value of the activity property.

This accessor method returns a reference to the live list, not a snapshot. Therefore any modification you make to the returned list will be present inside the JAXB object. This is why there is not a `set` method for the activity property.

For example, to add a new item, do as follows:

```
getActivity() .add(newItem);
```

Objects of the following type(s) are allowed in the list [Activity](#)

BigInteger [getCount](#) ()

Gets the value of the count property.

Returns:

possible object is [BigInteger](#)

[Link](#) getLink ()

Gets the value of the link property.

Returns:

possible object is [Link](#)

[PaginationInfo](#) getPaginationInfo ()

Gets the value of the paginationInfo property.

Returns:

possible object is [PaginationInfo](#)

void setCount (**BigInteger** value)

Sets the value of the count property.

Parameters:

<i>value</i>	allowed object is BigInteger
--------------	--

void setLink ([Link](#) value)

Sets the value of the link property.

Parameters:

<i>value</i>	allowed object is Link
--------------	--

void setPaginationInfo ([PaginationInfo](#) value)

Sets the value of the paginationInfo property.

Parameters:

<i>value</i>	allowed object is PaginationInfo
--------------	--

Detailed Description

Activities Schema

This schema contains [Activities](#) details.

XML Schema File

model/v15/xsd/interaction/activity.xsd

Name	Description	Type
link	Can be self link or link to "activity"	Link
activity	Can have multiple activity elements. holding details of the activity	Activity
paginationInfo	Pagination details of activities	PaginationInfo

Member Function Documentation

`java.util.List<Activity> getActivity ()`

Gets the value of the activity property.

This accessor method returns a reference to the live list, not a snapshot. Therefore any modification you make to the returned list will be present inside the JAXB object. This is why there is not a `set` method for the activity property.

For example, to add a new item, do as follows:

```
getActivity() .add(newItem);
```

Objects of the following type(s) are allowed in the list [Activity](#)

`BigInteger getCount ()`

Gets the value of the count property.

Returns:

possible object is [BigInteger](#)

[Link](#) getLink ()

Gets the value of the link property.

Returns:

possible object is [Link](#)

[PaginationInfo](#) getPaginationInfo ()

Gets the value of the paginationInfo property.

Returns:

possible object is [PaginationInfo](#)

void setCount ([BigInteger](#) value)

Sets the value of the count property.

Parameters:

<i>value</i>	allowed object is BigInteger
--------------	--

void setLink ([Link](#) value)

Sets the value of the link property.

Parameters:

<i>value</i>	allowed object is Link
--------------	--

void setPaginationInfo ([PaginationInfo](#) value)

Sets the value of the paginationInfo property.

Parameters:

<i>value</i>	allowed object is PaginationInfo
--------------	--

Detailed Description

Activity Schema

This schema has the definition of [Activity](#).

XML Schema File

model/v12/xsd/interaction/activity.xsd

Name	Description	Type
id	ID of the activity.	Long
link	Link to the current activity.	Link
case	Brief information about the cases of the activity.	Case
department	Information about the department of the activity.	Department
mode	Indicates the mode of the activity.	L10NString
type	Information about the type of the activity.	Type
status	Information about the status of the activity.	Status
isSecure	Indicates whether the activity secure or not.	Boolean
sentOnBehalf	Indicates whether the activity was created by a customer on behalf of another customer	Boolean
priority	Indicates the priority of the activity.	Int
created	This has information about the creation of the activity (who and when).	DateAndUser
lastModified	This has information about the modification of the activity (who and when).	DateAndUser
dueDate	Indicates the due date of this activity.	DateTime
subject	This contains the subject of this activity.	String
userLastWorked	This has information about the user who last worked on this activity.	User
customer	This has information about the customer of this activity.	Customer
classifications	This contains the classification of the activity.	Classifications
queue	This has information about	Queue

	the queue associated with this activity.	
attachments	This has information about the attachments of this activity.	Attachments
notes	This has information about the notes of this activity.	countAndLink
contactPointData	This contains the contact point information.	String
lastDepartment	This contains information about the previous department of this activity.	Department
payload	This has information about the payload of the activity. This contains the channel specific information for this activity. Possible payloads are email, chat, calltrack, task, social, web and usercreated. This will have only one of the payloads.	PayLoad
customAttributes	This contains the custom attributes of the activity.	CustomAttributes

Member Function Documentation

[Attachments](#) getAttachments ()

Gets the value of the attachments property.

Returns:

possible object is [Attachments](#)

[Case](#) getCase ()

Gets the value of the case property.

Returns:

possible object is [Case](#)

[Classifications](#) getClassifications ()

Gets the value of the classifications property.

Returns:

possible object is [Classifications](#)

java.lang.String getContactPointData ()

Gets the value of the contactPointData property.

Returns:

possible object is [java.lang.String](#)

[DateAndUser](#) getCreated ()

Gets the value of the created property.

Returns:

possible object is [DateAndUser](#)

[CustomAttributes](#) getCustomAttributes ()

Gets the value of the customAttributes property.

Returns:

possible object is [CustomAttributes](#)

[Customer](#) getCustomer ()

Gets the value of the customer property.

Returns:

possible object is [Customer](#)

[Department](#) getDepartment ()

Gets the value of the department property.

Returns:

possible object is [Department](#)

java.lang.String getDueDate ()

Gets the value of the dueDate property.

Returns:

possible object is [java.lang.String](#)

long getId ()

Gets the value of the id property.

Returns:

possible object is [Long](#)

[Department](#) getLastDepartment ()

Gets the value of the lastDepartment property.

Returns:

possible object is [Department](#)

[DateAndUser](#) getLastModified ()

Gets the value of the lastModified property.

Returns:

possible object is [DateAndUser](#)

[Link](#) getLink ()

Gets the value of the link property.

Returns:

possible object is [Link](#)

[L10NString](#) getMode ()

Gets the value of the mode property.

Returns:

possible object is [L10NString](#)

[CountAndLink](#) getNotes ()

Gets the value of the notes property.

Returns:

possible object is [CountAndLink](#)

[Payload](#) getPayload ()

Gets the value of the payload property.

Returns:

possible object is [Payload](#)

java.lang.String getPriority ()

Gets the value of the priority property.

Returns:

possible object is [java.lang.String](#)

[Queue](#) getQueue ()

Gets the value of the queue property.

Returns:

possible object is [Queue](#)

[Status](#) getStatus ()

Gets the value of the status property.

Returns:

possible object is [Status](#)

java.lang.String getSubject ()

Gets the value of the subject property.

Returns:

possible object is [java.lang.String](#)

[Type](#) getType ()

Gets the value of the type property.

Returns:

possible object is [Type](#)

[User](#) getUserLastWorked ()

Gets the value of the userLastWorked property.

Returns:

possible object is [User](#)

Boolean isIsSecure ()

Gets the value of the isSecure property.

Returns:

possible object is [Boolean](#)

Boolean isSentOnBehalf ()

Gets the value of the sentOnBehalf property.

Returns:

possible object is [Boolean](#)

void setAttachments ([Attachments](#) value)

Sets the value of the attachments property.

Parameters:

<i>value</i>	allowed object is Attachments
--------------	---

void setCase ([Case](#) value)

Sets the value of the case property.

Parameters:

<i>value</i>	allowed object is Case
--------------	--

void setClassifications ([Classifications](#) value)

Sets the value of the classifications property.

Parameters:

<i>value</i>	allowed object is Classifications
--------------	---

void setContactPointData (java.lang.String value)

Sets the value of the contactPointData property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setCreated ([DateAndUser](#) value)

Sets the value of the created property.

Parameters:

<i>value</i>	allowed object is DateAndUser
--------------	---

void setCustomAttributes ([CustomAttributes](#) value)

Sets the value of the customAttributes property.

Parameters:

<i>value</i>	allowed object is CustomAttributes
--------------	--

void setCustomer ([Customer](#) value)

Sets the value of the customer property.

Parameters:

value	allowed object is Customer
-------	--

void setDepartment ([Department](#) value)

Sets the value of the department property.

Parameters:

value	allowed object is Department
-------	--

void setDueDate (java.lang.String value)

Sets the value of the dueDate property.

Parameters:

value	allowed object is java.lang.String
-------	--

void setId (long value)

Sets the value of the id property.

Parameters:

value	allowed object is Long
-------	--

void setIsSecure (Boolean value)

Sets the value of the isSecure property.

Parameters:

value	allowed object is Boolean
-------	---

void setLastDepartment ([Department](#) value)

Sets the value of the lastDepartment property.

Parameters:

value	allowed object is Department
-------	--

void setLastModified ([DateAndUser](#) value)

Sets the value of the lastModified property.

Parameters:

value	allowed object is DateAndUser
-------	---

void setLink ([Link](#) value)

Sets the value of the link property.

Parameters:

value	allowed object is Link
-------	--

void setMode ([L10NString](#) value)

Sets the value of the mode property.

Parameters:

<i>value</i>	allowed object is L10NString
--------------	--

void setNotes ([CountAndLink](#) *value*)

Sets the value of the notes property.

Parameters:

<i>value</i>	allowed object is CountAndLink
--------------	--

void setPayload ([Payload](#) *value*)

Sets the value of the payload property.

Parameters:

<i>value</i>	allowed object is Payload
--------------	---

void setPriority ([java.lang.String](#) *value*)

Sets the value of the priority property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setQueue ([Queue](#) *value*)

Sets the value of the queue property.

Parameters:

<i>value</i>	allowed object is Queue
--------------	---

void setSentOnBehalf ([Boolean](#) *value*)

Sets the value of the sentOnBehalf property.

Parameters:

<i>value</i>	allowed object is Boolean
--------------	---

void setStatus ([Status](#) *value*)

Sets the value of the status property.

Parameters:

<i>value</i>	allowed object is Status
--------------	--

void setSubject ([java.lang.String](#) *value*)

Sets the value of the subject property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setType ([Type](#) *value*)

Sets the value of the type property.

Parameters:

<i>value</i>	allowed object is Type
--------------	--

void setUserLastWorked ([User](#) value)

Sets the value of the userLastWorked property.

Parameters:

<i>value</i>	allowed object is User
--------------	--

Member Function Documentation

[Attachments](#) getAttachments ()

Gets the value of the attachments property.

Returns:

possible object is [Attachments](#)

[Case](#) getCase ()

Gets the value of the case property.

Returns:

possible object is [Case](#)

[Classifications](#) getClassifications ()

Gets the value of the classifications property.

Returns:

possible object is [Classifications](#)

java.lang.String getContactPointData ()

Gets the value of the contactPointData property.

Returns:

possible object is [java.lang.String](#)

[DateAndUser](#) getCreated ()

Gets the value of the created property.

Returns:

possible object is [DateAndUser](#)

[CustomAttributes](#) getCustomAttributes ()

Gets the value of the customAttributes property.

Returns:

possible object is [CustomAttributes](#)

[Customer](#) getCustomer ()

Gets the value of the customer property.

Returns:

possible object is [Customer](#)

[Department](#) getDepartment ()

Gets the value of the department property.

Returns:

possible object is [Department](#)

java.lang.String getDueDate ()

Gets the value of the dueDate property.

Returns:

possible object is [java.lang.String](#)

long getId ()

Gets the value of the id property.

Returns:

possible object is [Long](#)

[IssueType](#) getIssueType ()

Gets the value of the issueType property.

Returns:

possible object is [IssueType](#)

[Department](#) getLastDepartment ()

Gets the value of the lastDepartment property.

Returns:

possible object is [Department](#)

[DateAndUser](#) getLastModified ()

Gets the value of the lastModified property.

Returns:

possible object is [DateAndUser](#)

[Link](#) getLink ()

Gets the value of the link property.

Returns:

possible object is [Link](#)

[L10NString](#) getMode ()

Gets the value of the mode property.

Returns:

possible object is [L10NString](#)

[CountAndLink](#) getNotes ()

Gets the value of the notes property.

Returns:

possible object is [CountAndLink](#)

[Payload](#) getPayload ()

Gets the value of the payload property.

Returns:

possible object is [Payload](#)

java.lang.String getPriority ()

Gets the value of the priority property.

Returns:

possible object is [java.lang.String](#)

[Queue](#) getQueue ()

Gets the value of the queue property.

Returns:

possible object is [Queue](#)

[Status](#) getStatus ()

Gets the value of the status property.

Returns:

possible object is [Status](#)

java.lang.String getSubject ()

Gets the value of the subject property.

Returns:

possible object is [java.lang.String](#)

[Type](#) getType ()

Gets the value of the type property.

Returns:

possible object is [Type](#)

[User](#) getUserLastWorked ()

Gets the value of the userLastWorked property.

Returns:

possible object is [User](#)

Boolean isIsRead ()

Gets the value of the isRead property.

Returns:

possible object is [Boolean](#)

Boolean isIsSecure ()

Gets the value of the isSecure property.

Returns:

possible object is [Boolean](#)

Boolean isSentOnBehalf ()

Gets the value of the sentOnBehalf property.

Returns:

possible object is [Boolean](#)

void setAttachments ([Attachments](#) value)

Sets the value of the attachments property.

Parameters:

<i>value</i>	allowed object is Attachments
--------------	---

void setCase ([Case](#) value)

Sets the value of the case property.

Parameters:

<i>value</i>	allowed object is Case
--------------	--

void setClassifications ([Classifications](#) value)

Sets the value of the classifications property.

Parameters:

<i>value</i>	allowed object is Classifications
--------------	---

void setContactPointData (java.lang.String value)

Sets the value of the contactPointData property.

Parameters:

value	allowed object is java.lang.String
-------	--

void setCreated ([DateAndUser](#) value)

Sets the value of the created property.

Parameters:

value	allowed object is DateAndUser
-------	---

void setCustomAttributes ([CustomAttributes](#) value)

Sets the value of the customAttributes property.

Parameters:

value	allowed object is CustomAttributes
-------	--

void setCustomer ([Customer](#) value)

Sets the value of the customer property.

Parameters:

value	allowed object is Customer
-------	--

void setDepartment ([Department](#) value)

Sets the value of the department property.

Parameters:

value	allowed object is Department
-------	--

void setDueDate (java.lang.String value)

Sets the value of the dueDate property.

Parameters:

value	allowed object is java.lang.String
-------	--

void setId (long value)

Sets the value of the id property.

Parameters:

value	allowed object is Long
-------	--

void setIsRead (Boolean value)

Sets the value of the isRead property.

Parameters:

value	allowed object is Boolean
-------	---

void setIsSecure (Boolean value)

Sets the value of the isSecure property.

Parameters:

<i>value</i>	allowed object is Boolean
--------------	---

void setIssueType ([IssueType](#) *value*)

Sets the value of the issueType property.

Parameters:

<i>value</i>	allowed object is IssueType
--------------	---

void setLastDepartment ([Department](#) *value*)

Sets the value of the lastDepartment property.

Parameters:

<i>value</i>	allowed object is Department
--------------	--

void setLastModified ([DateAndUser](#) *value*)

Sets the value of the lastModified property.

Parameters:

<i>value</i>	allowed object is DateAndUser
--------------	---

void setLink ([Link](#) *value*)

Sets the value of the link property.

Parameters:

<i>value</i>	allowed object is Link
--------------	--

void setMode ([L10NString](#) *value*)

Sets the value of the mode property.

Parameters:

<i>value</i>	allowed object is L10NString
--------------	--

void setNotes ([CountAndLink](#) *value*)

Sets the value of the notes property.

Parameters:

<i>value</i>	allowed object is CountAndLink
--------------	--

void setPayload ([Payload](#) *value*)

Sets the value of the payload property.

Parameters:

<i>value</i>	allowed object is Payload
--------------	---

void setPriority ([java.lang.String](#) *value*)

Sets the value of the priority property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setQueue ([Queue](#) value)

Sets the value of the queue property.

Parameters:

<i>value</i>	allowed object is Queue
--------------	---

void setSentOnBehalf ([Boolean](#) value)

Sets the value of the sentOnBehalf property.

Parameters:

<i>value</i>	allowed object is Boolean
--------------	---

void setStatus ([Status](#) value)

Sets the value of the status property.

Parameters:

<i>value</i>	allowed object is Status
--------------	--

void setSubject ([java.lang.String](#) value)

Sets the value of the subject property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setType ([Type](#) value)

Sets the value of the type property.

Parameters:

<i>value</i>	allowed object is Type
--------------	--

void setUserLastWorked ([User](#) value)

Sets the value of the userLastWorked property.

Parameters:

<i>value</i>	allowed object is User
--------------	--

ActivityAttachmentDetailsExamples Class Reference

Detailed Description

Examples for Get Activity Attachment Details

Example 1 - Get details of an attachment

This example demonstrates the following:

- Getting details of an attachment of an activity without specifying any additional query parameters.

XML

Request

Method	URL
GET	/ws/v12/interaction/activity/1224/attachment/1011

Accept-Language	en-US

Response

HTTP/1.1 200 OK

Response headers

Name	Value
X-egain-session	current session ID
Content-Type	application/json

Response body

```
{
  "attachment": {
    "id": "1011",
    "link": {
      "rel": "self",
      "href": "/system/ws/v12/interaction/activity/1224/attachment/1011"
    },
    "fileName": "Gift Coupon.jpg",
    "contentType": "image/jpeg",
    "size": "172276",
    "encodingType": "Base 64",
    "isBlocked": "false"
  }
}
```

Example 2 - Get contentUrl along with details for an attachment

This example demonstrates the following:

- Getting the contentUrl of the attachment as part of getting the details.

XML

Request

Method	URL
GET	/ws/v12/interaction/activity/1224/attachment/1011?\$attribute=contentUrl

Request headers

Name	Value
X-egain-session	Valid session ID
Accept	application/xml
Accept-Language	en-US

Response
HTTP/1.1 200 OK

Response headers

Name	Value
X-egain-session	current session ID
Content-Type	application/xml

Response body

```
<?xml version="1.0" encoding="UTF-8"?><attachments
xmlns="http://bindings.egain.com/ws/model/v12/gen/interaction/attachment">  <attachment
id="1011">    <link rel="self" href="/system/ws/v12/interaction/activity/1224/attachment/1011"
/>    <fileName>Gift Coupon.jpg</fileName>    <contentType>image/pjpeg</contentType>
<size>172276</size>    <encodingType>Base 64</encodingType>    <isBlocked>>false</isBlocked>
<contentUrl>/system/ws/internal/stream/a9a2bb06-6970-4f86-a648-cb9f2c036916</contentUrl>
</attachment></attachments>
```

JSON

Request

Method	URL
GET	/ws/v12/interaction/activity/1224/attachment/1011?\$attribute=contentUrl

Request headers

Name	Value
X-egain-session	Valid session ID
Accept	application/json
Accept-Language	en-US

Response
HTTP/1.1 200 OK

Response headers

Name	Value
X-egain-session	current session ID
Content-Type	application/json

Response body

```
{  "attachment": {    "id": "1011",    "link": {      "rel": "self",      "href": "/system/ws/v12/interaction/activity/1224/attachment/1011"    },    "fileName": "Gift Coupon.jpg",    "contentType": "image/pjpeg",    "size": "172276",    "encodingType": "Base 64",    "isBlocked": "false",    "contentUrl": "/system/ws/internal/stream/cba727e0-abad-4e2a-8e0c-7048ad3a0c18"  } }
```

Example 3 - Get all attributes along with details for an attachment

This example demonstrates the following:

- Getting all additional attributes along with details of an attachment. Since 'contentUrl' is the only additional attribute that is supported, it is returned in the response.

XML

Request

Method	URL
GET	/ws/v12/interaction/activity/1224/attachment/1011?\$attribute=all

Request headers

Name	Value
X-egain-session	Valid session ID
Accept	application/xml
Accept-Language	en-US

Response

HTTP/1.1 200 OK

Response headers

Name	Value
X-egain-session	current session ID
Content-Type	application/xml

Response body

```
<?xml version="1.0" encoding="UTF-8"?><attachments
xmlns="http://bindings.egain.com/ws/model/v12/gen/interaction/attachment">  <attachment
id="1011">    <link rel="self" href="/system/ws/v12/interaction/activity/1224/attachment/1011"
/>    <fileName>Gift Coupon.jpg</fileName>    <contentType>image/pjpeg</contentType>
<size>172276</size>    <encodingType>Base 64</encodingType>    <isBlocked>>false</isBlocked>
<contentUrl>/system/ws/internal/stream/a9a2bb06-6970-4f86-a648-cb9f2c036916</contentUrl>
</attachment></attachments>
```

JSON

Request

Method	URL
GET	/ws/v12/interaction/activity/1224/attachment/1011?\$attribute=all

Request headers

Name	Value
X-egain-session	Valid session ID
Accept	application/json
Accept-Language	en-US

Response

HTTP/1.1 200 OK

Response headers

Name	Value
X-egain-session	current session ID
Content-Type	application/json

Response body

```
{  "attachment": {    "id": "1011",    "link": {      "rel": "self",      "href": "/system/ws/v12/interaction/activity/1224/attachment/1011"    },    "fileName": "Gift Coupon.jpg",    "contentType": "image/pjpeg",    "size": "172276",    "encodingType": "Base 64",    "isBlocked": "false",    "contentUrl": "/system/ws/internal/stream/cba727e0-abad-4e2a-8e0c-7048ad3a0c18"  }  }
```

Response

HTTP/1.1 200 OK

Response headers

Name	Value
X-egain-session	current session ID
Content-Type	application/json

Response body

```
{  "attachment": [    {      "id": "1006",      "link": {        "rel": "self",        "href": "/system/ws/v12/interaction/activity/1201/attachment/1006"      },      "fileName": "2.jpg",      "contentType": "image/jpeg",      "size": "4595",      "charset": "UTF-8",      "isBlocked": "false"    },    {      "id": "1007",      "link": {        "rel": "self",        "href": "/system/ws/v12/interaction/activity/1201/attachment/1007"      },      "fileName": "3.jpg",      "contentType": "image/jpeg",      "size": "4595",      "charset": "UTF-8",      "isBlocked": "false"    },    {      "id": "1008",      "link": {        "rel": "self",        "href": "/system/ws/v12/interaction/activity/1201/attachment/1008"      },      "fileName": "1.jpg",      "contentType": "image/jpeg",      "size": "4595",      "charset": "UTF-8",      "isBlocked": "false"    }  ]}
```

ActivityByIDsExamples Class Reference

Detailed Description

Examples for GET Activities by IDs

Example 1 - Get all attributes for an email activity

This example demonstrates the following:

- Getting all attributes of a single email activity.
- Representation of all attributes of an email activity, including custom attributes. Note that payload.email.contents is returned in this case as only a single activity is requested. If multiple activities were requested, contents node would be omitted even if payload were explicitly requested.

XML

Request

Method	URL
GET	/ws/v12/interaction/activity/1011?\$attribute=all

Example 2 - Get all attributes for a chat activity

This example demonstrates the following:

- Getting all attributes of a single chat activity. of all attributes of a chat activity, including custom attributes. Note that payload.chat.transcript is returned in this case as only a single activity is requested. If multiple activities were requested, transcript node would be omitted even if payload were explicitly requested.

XML

Request

Method	URL
GET	/ws/v12/interaction/activity/1017?\$attribute=all

Request headers

Name	Value
X-egain-session	Valid session ID
Accept	application/xml
Accept-Language	en-US

Response
HTTP/1.1 200 OK
Response headers

Name	Value
X-egain-session	current session ID
Content-Type	application/xml

Response body

```

Example 6 - Get an additional attribute for multiple activities sorted on department name

This example demonstrates the following:

- Getting summary attributes and an additional attribute for multiple activities. The additional attribute in this example is "created".
- Sorting on department name, in ascending order.

Example 7 - Get an additional custom attribute for a single activity

This example demonstrates the following:

- Getting summary attributes and a custom attribute for a single activity. The custom attribute in this example is "custom.complainttype".
- Representation of the custom attribute in the response.

```

Example 8 - Get summary attributes and payload for activities of all types

This example demonstrates the following:

- Getting summary attributes and payload for multiple activities. Even though payload attribute is explicitly requested, contents node for each activity is omitted because this is a multi-activity request.
- Representation of summary attributes along with "payload" for all activities types - email, chat.
- Representation of an email activity when the activity is sent by a customer on behalf of another customer. This also shows the representation of "sentBy" in the email payload.
- Representation of an activity without a customer. In this example, the "task" activity is not associated with a customer, and hence, customer attribute is not present.
- Default sorting (on activityId in ascending order)

XML

Request

Method	URL

ActivityChangeCaseExamples Class Reference

Detailed Description

Examples for changing case of activities

Example 1 - Change case of an activity to a new case without optional attributes

This example demonstrates the following:

- Changing the case of a single activity to a new case. The new case is created without any optional attributes. Since all attributes of a case are optional, the case is created without providing any attributes.

XML

Request

Method	URL
PUT	/ws/v12/interaction/activity/1005/changeCase

Request headers

Name	Value
X-egain-session	Valid session ID
Accept	application/xml
Content-Type	application/xml
Accept-Language	en-US

Request body:

```
<?xml version="1.0" encoding="UTF-8" standalone="yes"?><case xmlns="http://bindings.egain.com/ws/model/v12/gen/interaction/case"xmlns:ns2="http://bindings.egain.com/ws/model/v12/gen/common" />
```

Response:

HTTP/1.1 201 Created

Response headers

Name	Value
X-egain-session	current session ID
Content-Type	application/xml
Location	/system/ws/v12/interaction/case/1019

JSON

Request

Method	URL
PUT	/ws/v12/interaction/activity/1005/changeCase

Request headers

Name	Value
X-egain-session	Valid session ID
Accept	application/json
Content-Type	application/json
Accept-Language	en-US

Request body:

{}

Response:

HTTP/1.1 201 Created

Response headers

Name	Value
X-egain-session	current session ID
Content-Type	application/json
Location	/system/ws/v12/interaction/case/1019

Example 2 - Change case of an activity to an existing case

This example demonstrates the following:

- Changing the case of an activity to an existing case.

XML

Request

Method	URL
PUT	/ws/v12/interaction/activity/1005/changeCase

Request headers

Name	Value
X-egain-session	Valid session ID
Accept	application/xml
Content-Type	application/xml
Accept-Language	en-US

Request body:

```
<?xml version="1.0" encoding="UTF-8" standalone="yes"?><case
id="1011"xmlns="http://bindings.egain.com/ws/model/v12/gen/interaction/case"xmlns:ns2="http://bin
dings.egain.com/ws/model/v12/gen/common" />
```

Response:

HTTP/1.1 204 No Content

Response headers

Name	Value
X-egain-session	current session ID
Content-Type	application/xml

JSON

Request

Method	URL
PUT	/ws/v12/interaction/activity/1005/changeCase

Request headers

Name	Value
X-egain-session	Valid session ID
Accept	application/json
Content-Type	application/json
Accept-Language	en-US

Request body:

```
{ "id": 1011 }
```

Response:

HTTP/1.1 204 No Content

Response headers

Name	Value
X-egain-session	current session ID
Content-Type	application/json

Example 3 - Change case of multiple activities to an existing case

This example demonstrates the following:

- Changing the case of a multiple activities to an existing case.

XML

Request

Method	URL
PUT	/ws/v12/interaction/activity/10

	05,1006/changeCase
--	--------------------

Request headers

Name	Value
X-egain-session	Valid session ID
Accept	application/xml
Content-Type	application/xml
Accept-Language	en-US

Request body:

```
<?xml version="1.0" encoding="UTF-8" standalone="yes"?><case
id="1011"xmlns="http://bindings.egain.com/ws/model/v12/gen/interaction/case"xmlns:ns2="http://bin
dings.egain.com/ws/model/v12/gen/common" />
```

Response:

HTTP/1.1 204 No Content

Response headers

Name	Value
X-egain-session	current session ID
Content-Type	application/xml

JSON

Request

Method	URL
PUT	/ws/v12/interaction/activity/1005,1006/changeCase

Request headers

Name	Value
X-egain-session	Valid session ID
Accept	application/json
Content-Type	application/json
Accept-Language	en-US

Request body:

```
{ "id": 1011 }
```

Response:

HTTP/1.1 204 No Content

Response headers

Name	Value
X-egain-session	current session ID
Content-Type	application/json

Example 4 - Change case of multiple activities to a new case by providing all case attributes

This example demonstrates the following:

- Changing the case of multiple activities to a new case.
- Creating the new case with all attributes, including custom attributes.

XML

Request

Method	URL
PUT	/ws/v12/interaction/activity/1005,1006/changeCase

Request headers

Name	Value
X-egain-session	Valid session ID
Accept	application/xml
Content-Type	application/xml
Accept-Language	en-US

Request body:

```
<?xml version="1.0" encoding="UTF-8" standalone="yes"?><case xmlns="http://bindings.egain.com/ws/model/v12/gen/interaction/case" xmlns:ns2="http://bindings.egain.com/ws/model/v12/gen/common">
  <dueDate>2020-11-30T18:30:00.000Z</dueDate>
  <severity>
    <ns2:value>medium</ns2:value>

ActivityChangeCustomerExamples Class Reference

Detailed Description

Examples for changing customer of activities

Example 1 - Change customer of an activity

This example demonstrates the following:

- Changing the customer of a single activity.

XML

Request

Method	URL
PUT	/ws/v12/interaction/activity/changecustomer

Request headers

Name	Value
X-egain-session	Valid session ID
Accept	application/xml
Content-Type	application/xml
Accept-Language	en-US

Request body:

```
<?xml version="1.0" encoding="UTF-8"?><activities xmlns="http://bindings.egain.com/ws/model/v12/gen/interaction/activity"xmlns:ns2="http://bindings.egain.com/ws/model/v12/gen/interaction/customer"xmlns:ns3="http://bindings.egain.com/ws/model/v12/gen/interaction/contactperson"xmlns:ns4="http://bindings.egain.com/ws/model/v12/gen/interaction/contactpoint"><activity id="1000">  <customer>    <ns2:contactPersons>      <ns3:contactPerson>        <ns3:contactPoints>          <ns4:contactPoint id="1000">            </ns4:contactPoint>          </ns3:contactPoints>        </ns3:contactPerson>      </ns2:contactPersons>    </customer></activity></activities>
```

Response:

HTTP/1.1 204 No Content

Response headers

Name	Value
X-egain-session	current session ID
Content-Type	application/xml

JSON

Request

Method	URL
PUT	/ws/v12/interaction/activity/changecustomer

Request headers

Name	Value
X-egain-session	Valid session ID
Accept	application/json
Content-Type	application/json
Accept-Language	en-US

Request body:

```
{ "activity": [ { "id": "1000", "customer": { "contactPersons": { "contactPerson": [ { "id": "1000" } ] } } } ] }
```

Response:

HTTP/1.1 204 No Content

Response headers

Name	Value
X-egain-session	current session ID
Content-Type	application/json

Example 2 - Change customer of multiple activities using different contact points

This example demonstrates the following:

- Changing customer of multiple activities.
- Associating activities with different contact points.

XML

Request

Method	URL
PUT	/ws/v12/interaction/activity/changecustomer

Request headers

Name	Value
X-egain-session	Valid session ID
Accept	application/xml
Content-Type	application/xml

Accept-Language	en-US
-----------------	-------

Request body:

```
<?xml version="1.0" encoding="UTF-8"?><activities

ActivityCommonInfoPage Class Reference

Detailed Description

Supported values of some Common Query Parameters that appear in Activity Resource APIs

NOTE: each *common parameter* described below is not necessarily supported by all Activity APIs. Therefore, first refer to specific API documentation to see which *common parameters* that API supports.

Values of \$attribute common parameter supported by Activity Resource

Use \$attribute to request additional attributes/elements of resource representation, beyond those always returned by server. The value of \$attribute must be a comma separated list of attribute names. For example,

```
GET .../context/interaction/activity/1000?$attribute=payload
```

```
.../context/interaction/activity/1000?$attribute=created,custom.abc
```

```
GET .../context/interaction/activity/1000?$attribute=all
```

Name	Description	Schema/type returned by server
all	This is a special keyword that prompts server to return all available resource attributes	N/A
created	Activity creation date and information about who created the activity. Activity can be created by either a user or a contact. If created by a user, created.user.firstName and created.user.lastName will be returned. If created by a contact, created.contact.firstName and created.contact.lastName will be returned.	Created Schema
payload	Type-specific details of this activity, e.g. mail, chat etc. NOTE: payload.email.contents, payload.chat.transcript nodes will only be returned by server when a single activity is requested by ID through	Payload Schema

	"Get Activity by ID" API.	
custom.<name>	Name of a custom attribute configured for activity object	CustomAttributes Schema

Values of \$sort common parameter supported by Activity Resource

Activities returned in server response are sorted based on the attribute supplied under \$sort . See *Description* column below for specifics.

Name	Description
id	Results are sorted on activity IDs
case	Results are sorted on case ID of each activity

Summary attributes of Activity Resource

Activity Resource always returns <activities> representation, that contains one or more <activity> representations and <paginationInfo> element if applicable.

Activity summary

Name	Description	Schema/type
id	Activity ID	Long
link	Self link that can be used to retrieve this activity	Link Schema
case	The case to which this activity belongs (ID and self-link)	Case Schema
mode	Activity mode	L10NString Schema
type	Activity type (email, chat etc.)	Type Schema
isSecure	Indicates whether activity is marked secure	Boolean
status	Activity status	Status Schema
isRead	Indicates whether activity has been read by the customer	Boolean
lastModified	Last modified user details (firstName, lastName)	DateAndUser
subject	Activity subject	String
customer	The customer associated with this activity	Customer Schema
attachments	Field holding the count and a link that can be used to retrieve all attachments of this activity	countAndLink Schema

ActivityCommonInfoPage Class Reference

Detailed Description

Supported values of some Common Query Parameters that appear in Activity Resource APIs

NOTE: each *common parameter* described below is not necessarily supported by all Activity APIs. Therefore, first refer to specific API documentation to see which *common parameters* that API supports.

Values of \$attribute common parameter supported by Activity Resource

Use `$attribute` to request additional attributes/elements of resource representation, beyond those always returned by server. The value of `$attribute` must be a comma separated list of attribute names. For example,

```
GET .../interaction/activity/1000?$attribute=payload
```

```
GET .../interaction/activity/1000?$attribute=created,userLastWorked,custom.abc
```

```
GET .../interaction/activity/1000?$attribute=all
```

Name	Description	Schema/type returned by server
all	This is a special keyword that prompts server to return all available resource attributes	N/A
lastDepartment	The last department this activity belonged to	Department Schema
created	Activity creation details (user and date)	Created Schema
contactPointData	Activity contact point data	String
payload	Type-specific details of this activity, e.g. mail, chat etc. NOTE: payload.email.contents, payload.chat.transcript nodes will only be returned by server when a single activity is requested by ID through "Get Activities by IDs" API.	Payload Schema
userLastWorked	Information about the last user who worked on this activity	User Schema
classifications	Information about classifications for this activity	Classifications Schema
custom.<name>	Name of a custom attribute	CustomAttributes Schema

	configured for activity object	
--	--------------------------------	--

Values of \$sort common parameter supported by Activity Resource

Activities returned in server response are sorted based on the attribute supplied under \$sort . See *Description* column below for specifics.

Name	Description
id	Results are sorted on activity IDs
department	Results are sorted on department name of each activity
case	Results are sorted on case ID of each activity
dueDate	Results are sorted on due date of each activity
createdDate	Results are sorted on created date of each activity
lastModifiedDate	Results are sorted on last modified date of each activity
custom.<name>	Results are sorted on supplied name of custom attribute of activity object

Summary attributes of Activity Resource

Activity Resource always returns <activities> representation, that contains one or more <activity> representations and <paginationInfo> element if applicable.

Activity summary

Name	Description	Schema/type
id	Activity ID	Long
link	Self link that can be used to retrieve this activity	Link Schema
case	The case to which this activity belongs (ID and self-link)	Case Schema
department	Department of the activity (ID and name)	Department Schema
mode	Activity mode	L10NString Schema
type	Activity type (email, chat etc.)	Type Schema
isSecure	Indicates whether the activity is a secure activity or not	Boolean
sentOnBehalf	Indicates whether the activity was sent by a customer on behalf of another customer	Boolean
status	Activity status	Status Schema

priority	The priority level of this activity	Int
lastModified	Details of the last modification of the activity (date and user info)	Created Schema
dueDate	The due date of the activity	DateTime
subject	Activity subject	String
customer	The customer associated with this activity	Customer Schema
queue	The queue this activity belongs to (ID and name)	Queue Schema
attachments	Field holding the count and a link that can be used to retrieve all attachments of this activity	countAndLink Schema
notes	Field holding the count and a link that can be used to retrieve all notes of this activity	countAndLink Schema

ActivityExampleHeadersPostSection Class Reference

Detailed Description

Request

Method	URL
POST	/ws/v12/interaction/activity

Request headers

Name	Value
X-egain-session	Valid session ID
Content-Type	application/xml
Accept-Language	en-US

ActivitySearchExamples Class Reference

Detailed Description

Examples for Activity Search

Example 1 - Search for activities by customer

This example demonstrates the following:

- Search for activities based on customer ID.
- Requesting all attributes to be returned in the response.
- Representation of all supported attributes in the response.
- Default sorting (on activity ID in ascending order)

XML

Request

```

Example 2 - Search for activities by case with pagination parameters

This example demonstrates the following:

- Search for activities based on case ID.
- Getting summary attributes along with payload for the activities.
- Provide pagination parameters in the request (\$pagenum and \$pagesize). The paginationInfo element in the response shows the links to the previous and next pages.
- Default sorting (on activity ID in ascending order)

XML

Request

Method	URL
GET	/ws/v12/interaction/activity?case=1002&\$attribute=payload&\$pagenum=2&\$pagesize=2

Request headers

Name	Value

```

Example 3 - Search for activities by custom attribute with range parameters

This example demonstrates the following:

- Search for activities based on custom attribute.
- Specifying a custom attribute to be returned in the response.

- Using range parameters (\$rangestart and \$rangesize) in the request. Note that paginationInfo node is not returned for range parameters.
- Default sorting (on activity ID in ascending order)

Example 4 - Search for activities by status and last modified date

This example demonstrates the following:

- Search for activities that are in status "assigned" and substatus "in_progress" that were modified on or after a given date.
- Default sorting (on activity ID in ascending order).

```

Example 5 - Search for activities by assigned user with sorting on last modified date

This example demonstrates the following:

- Search for activities that are assigned to a user.
- Sorting on last modified date of the activity in descending order.

Example 6 - Search for activities by queue and when created date

This example demonstrates the following:

- Search for activities that are in a queue and created within a date range.
- Sorting on created date of the activity in ascending order.
- Specifying to get an additional attribute "created" in the response.

Example 7 - Search for activities by mode and last modified date

This example demonstrates the following:

- Search for activities with mode "inbound" and modified on or before a given date.
- Default sorting (on activity ID in ascending order).

Example 8 - Search for activities by status, assigned user name and last modified date

This example demonstrates the following:

- Search for open activities that were last modified within a date range and are assigned to a particular user.
- Default sorting (on activity ID in ascending order).

ActivitySearchPage Class Reference

Detailed Description

Activity Search

Overview

This API allows users to search for activities based on various criteria. If no activities match the search criteria, the server will respond with 204 success code and an empty body. This API only supports exact match searches; partial matches are not supported. For example, if a client searches for activities where customer ID is 1080, then only activities with customer ID 1080 will be returned. Activities associated with customer ID 10801 will not be returned.

Since:

11.6

APIs

Method	URL	Description
GET	/ws/v12/interaction/activity?customer={ID}	Retrieve activities for one customer ID: {ID}
GET	/ws/v12/interaction/activity?case={ID}	Retrieve activities for one case ID: {ID}
GET	/ws/v12/interaction/activity?status={VAL}	Retrieve activities having status <name> with value: {VAL}
GET	/ws/v12/interaction/activity?mode={VAL}	Retrieve activities having mode with value: {VAL}
GET	/ws/v12/interaction/activity?assignedTo={ID}	Retrieve activities assigned to a user with ID: {ID}
GET	/ws/v12/interaction/activity?queue={ID}	Retrieve activities for one queue ID: {ID}
GET	/ws/v12/interaction/activity?createdDate={RANGE}	Retrieve activities for a range of creation dates with value : {RANGE}
GET	/ws/v12/interaction/activity?lastModifiedDate={RANGE}	Retrieve activities for a range of last modification date with value: {RANGE}
GET	/ws/v12/interaction/activity?custom.<name>={VAL}	Retrieve activities having custom attribute <name> with value: {VAL}
GET	/ws/v12/interaction/activity?assignedUse	Retrieve activities assigned to a user with name: {VAL}

	rName={VAL}	
--	-------------	--

NOTE: You can mix and match one or more filter criteria listed above in any order. If more than one filter criteria are used, then response will only contain activities that satisfy all filter criteria.

Authentication

Authentication is required. The client must be logged in to call this API. Each API request must contain X-again-session request header returned by Login API.

Permissions

All of the following are required:

- 'View Agent Console' action.
- Only activities that satisfy one of the below conditions will be returned by server:
 - activity belongs to user's home department;
 - activity belongs to a department where the user is a foreign user;
 - the department of the activity is shared with the department of the user, and as part of this sharing, activity sharing is enabled as well.

Licenses

The logged in user must have the following licenses:

- ECE CIH Platform

Request

Request headers

Name	Description	Allowed values	Default value
X-again-session	Session ID obtained from Login API response header	N/A	N/A
Accept	Content type accepted by client	application/xml or application/json	N/A
Accept-Language	Language locale accepted by client (used for locale specific fields in resource representation and in error responses)	Supported 'Accept-Language' header codes	default system language

Supported API specific query parameters

One or more query parameters listed below can be supplied per API call:

- **case:** case ID to be used in activity search.
- **customer:** customer ID to be used in activity search.
- **custom** .<name>: custom attribute value for custom attribute <name> of an activity to be used in case search.
- **status:** status value of an activity. If activities are to be searched based on status and substatus both, the status value must be sent in the format: <status_value>:<substatus_value>. that substatus is optional, and if omitted, the filtering will happen on just the status. Some valid examples of status that can be used in filtering are: assigned:new, assigned:in-progress, assigned, awaiting_assignment. Refer [this page](#) for list of all supported out of the box activity status and substatus values., status can have a special-meaning value "open". If this value is specified, the filter will return all activities that are not in "completed" status.
- **mode:** mode value of an activity. Valid values for mode are: "inbound", "outbound", and "none". This returns the activities in specified mode.
- **assignedTo:** user ID to whom the activity is assigned. This returns the activities assigned to this user.
- **queue:** queue ID to be used in activity search. This returns the activities associated with this queue.
- **createdDate:** date of creation of activity to be used in activity search. This is a range query parameter. Range query parameter representation can be found [here](#).
- **lastModifiedDate:** date of last modification of an activity to be used in activity search. This is a range query parameter. Range query parameter representation can be found [here](#).
- **assignedUserName:** login name of the user to whom the activity is assigned. This returns the activities assigned to this user regardless of the activity status.

Supported common query parameters

Refer to [Supported Common Query Parameters in ECE REST API](#) page for detailed description of each common parameter listed below.

- \$attribute - [Values of \\$attribute common parameter supported by Activity Resource](#)
- \$sort - [Values of \\$sort common parameter supported by Activity Resource](#)
- \$order
- \$pagenum
- \$pagesize
- \$rangestart
- \$rangesize

Response

Response headers

Name	Description	Possible values
X-egain-session	Session ID of the current user session	N/A
Content-Type	Media type of response body	application/xml or application/json

Response body xml schemas:

- [Activities Schema](#) - used in case of success
- [Error](#) - used in case of error

Summary attributes

[Summary attributes of Activity Resource](#)

Additional attributes returned in server response if explicitly requested by client

Server can be prompted to return additional attributes of resource representation using `$attribute` common query parameter. [Values of \\$attribute common parameter supported by Activity Resource](#) for the list of allowed attribute names.

HTTP status codes

Success Status codes

200 - OK

- Matches are found for this search and returned in the response body.

204 - No Content

- No matches were found for given search criteria.
- Matches found for this search, however the requested page or range doesn't contain any results.

Failure Status codes

400 - Bad Request

- Unsupported query parameter is sent in the request.
- Unsupported value for query parameter is sent in the request.
- None of the API specific query parameter is provided (since at least one search criterion is required).
- Unsupported combination of common query parameters (`$order` provided without `$sort`, mixing of pagination and range parameters etc.).

401 - Unauthorized

- `X-egain-session` request header is missing.
- Session is invalid or expired.

403 - Forbidden

- The user does not have sufficient permissions. Refer the "Permissions" section for details.

406 - Not Acceptable

- Invalid 'Accept-Language' header value.

500 - Internal server error

Examples:

[Example 1 - Search for activities by customer](#)

[Example 2 - Search for activities by case with pagination parameters](#)

[Example 3 - Search for activities by custom attribute with range parameters](#)

[Example 4 - Search for activities by status and last modified date](#)

[Example 5 - Search for activities by assigned user with sorting on last modified date](#)

[Example 6 - Search for activities by queue and when created date](#)

[Example 7 - Search for activities by mode and last modified date](#)

[Example 8 - Search for activities by status, assigned user name and last modified date](#)

ActivitySearchSupportedStatusAndSubstatus Class Reference

Detailed Description

Supported Activity status and substatus values

Following out of the box activity status and substatus values are supported in ECE application:

Status Value	Substatus Value	Description
in_workflow		Activities picked up for processing by a workflow.
	ready_for_inbound_workflow	Activities ready to be processed by an inbound workflow.
	ready_for_outbound_workflow	Activities ready to be processed by an outbound workflow.
	ready_for_general_workflow	Activities ready to be processed by a general workflow.
	ready_for_transfer_workflow	Activities ready to be processed by a transfer workflow.
	error	Activities that could not be processed by a workflow and are in error state.
awaiting_assignment		Activities in a queue that are awaiting assignment to user.
	ready_for_assignment	Activities ready for assignment.
	ucce_awaiting_assignment	Activities awaiting assignment by Cisco Unified Contact Center Enterprise.
assigned		Activities assigned to a user.
	new	Activities that are assigned to the user but the user has not started to work on them.
	in_progress	Activities being worked on by the user.
in_precompletion		Activities being dispatched by the system.
completed		Completed activities.
	done	Activities completed successfully.
	abandoned_chat	Chat activities abandoned by a customer.

Public Member Functions

- [ContactPerson](#) [getContactPerson](#) ()
 - java.lang.String [getType](#) ()
 - [User](#) [getUser](#) ()
 - void [setContactPerson](#) ([ContactPerson](#) value)
 - void [setType](#) (java.lang.String value)
 - void [setUser](#) ([User](#) value)
-

Detailed Description

Actor Schema

This schema has the definition of [Actor](#) of a web activity.

XML Schema File

model/v12/xsd/interaction/activity.xsd

Name	Description	Type
type	This indicates the type of the actor. Possible value are anonymous user, authenticated customer, identified customer, authenticated agent and identified agent. The localized value of one of these string would be returned in this element.	String
user	At most, one of user or contact_person can be present. If the type is identified agent or authenticated agent, user node will be present, which will have information about the agent whose actions resulted in the web activity.	User
contact_person	At most, one of user or contact_person can be present. If the type is identified customer or authenticated customer, contact_person node will be present, which will have information about the customer whose actions resulted in the web activity.	ContactPerson

Member Function Documentation

[ContactPerson](#) getContactPerson ()

Gets the value of the contactPerson property.

Returns:

possible object is [ContactPerson](#)

java.lang.String getType ()

Gets the value of the type property.

Returns:

possible object is [java.lang.String](#)

[User](#) getUser ()

Gets the value of the user property.

Returns:

possible object is [User](#)

void setContactPerson ([ContactPerson](#) value)

Sets the value of the contactPerson property.

Parameters:

value	allowed object is ContactPerson
-------	---

void setType (java.lang.String value)

Sets the value of the type property.

Parameters:

value	allowed object is java.lang.String
-------	--

void setUser ([User](#) value)

Sets the value of the user property.

Parameters:

value	allowed object is User
-------	--

user	At most, one of user or contact_person can be present. If the type is identified agent or authenticated agent, user node will be present, which will have information about the agent whose actions resulted in the web activity.	User
contact_person	At most, one of user or contact_person can be present. If the type is identified customer or authenticated customer, contact_person node will be present, which will have information about the customer whose actions resulted in the web activity.	ContactPerson

Member Function Documentation

[ContactPerson](#) getContactPerson ()

Gets the value of the contactPerson property.

Returns:

possible object is [ContactPerson](#)

java.lang.String getType ()

Gets the value of the type property.

Returns:

possible object is [java.lang.String](#)

[User](#) getUser ()

Gets the value of the user property.

Returns:

possible object is [User](#)

void setContactPerson ([ContactPerson](#) value)

Sets the value of the contactPerson property.

Parameters:

value	allowed object is ContactPerson
-------	---

void setType (java.lang.String value)

Sets the value of the type property.

Parameters:

value	allowed object is java.lang.String
-------	--

void setUser ([User](#) value)

Sets the value of the user property.

Parameters:

value	allowed object is User
-------	--

Address Class Reference

Public Member Functions

- `java.util.List< java.lang.String > getAddress ()`
-

Detailed Description

Address Schema

This schema contains the definition of the [Address](#) type.

XML Schema File

`model/v12/xsd/interaction/activity.xsd`

Name	Description	Type
<code>address</code>	Contains an email address.	String

Member Function Documentation

`java.util.List<java.lang.String> getAddress ()`

Gets the value of the address property.

This accessor method returns a reference to the live list, not a snapshot. Therefore any modification you make to the returned list will be present inside the JAXB object. This is why there is not a `set` method for the address property.

For example, to add a new item, do as follows:

```
getAddress ().add(newItem);
```

Objects of the following type(s) are allowed in the list [java.lang.String](#)

Detailed Description

Alias Schema

This schema contains the definition of an email [Alias](#).

XML Schema File

model/v12/xsd/mail/alias.xsd

Name	Description	Type
id	ID of the Alias .	Long
name	Name of the Alias	String
value	The email address that is configured for this Alias	String
link	Link to the Alias	Link

Member Function Documentation

long [getId](#) ()

Gets the value of the id property.

Returns:

possible object is [Long](#)

[Link](#) [getLink](#) ()

Gets the value of the link property.

Returns:

possible object is [Link](#)

java.lang.String [getName](#) ()

Gets the value of the name property.

Returns:

possible object is [java.lang.String](#)

java.lang.String getValue ()

Gets the value of the value property.

Returns:

possible object is [java.lang.String](#)

void setId (long value)

Sets the value of the id property.

Parameters:

<i>value</i>	allowed object is Long
--------------	--

void setLink ([Link](#) value)

Sets the value of the link property.

Parameters:

<i>value</i>	allowed object is Link
--------------	--

void setName (java.lang.String value)

Sets the value of the name property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setValue (java.lang.String value)

Sets the value of the value property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

AllEmailAddresses Schema

This schema contains the definition of the [AllEmailAddresses](#) node of an email activity.

XML Schema File

model/v12/xsd/interaction/activity.xsd

Name	Description	Type
from	Email address of the sender of the email.	String
to	This contains a list of email addresses to which the email was sent.	Address
cc	This contains a list of email addresses which were copied on the email.	Address
bcc	This contains a list of email addresses which were blind-copied on the email.	Address
replyTo	This contains a list of email addresses to which the response to this email should be sent to.	Address
receiver	Email address of the receiver of the email.	String

Member Function Documentation

[Address](#) getBcc ()

Gets the value of the bcc property.

Returns:

possible object is [Address](#)

[Address](#) getCc ()

Gets the value of the cc property.

Returns:

possible object is [Address](#)

java.lang.String getFrom ()

Gets the value of the from property.

Returns:

possible object is [java.lang.String](#)

java.lang.String getReceiver ()

Gets the value of the receiver property.

Returns:

possible object is [java.lang.String](#)

[Address](#) getReplyTo ()

Gets the value of the replyTo property.

Returns:

possible object is [Address](#)

[Address](#) getTo ()

Gets the value of the to property.

Returns:

possible object is [Address](#)

void setBcc ([Address](#) value)

Sets the value of the bcc property.

Parameters:

<i>value</i>	allowed object is Address
--------------	---

void setCc ([Address](#) value)

Sets the value of the cc property.

Parameters:

<i>value</i>	allowed object is Address
--------------	---

void setFrom (java.lang.String value)

Sets the value of the from property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setReceiver (java.lang.String *value*)

Sets the value of the receiver property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setReplyTo ([Address](#) *value*)

Sets the value of the replyTo property.

Parameters:

<i>value</i>	allowed object is Address
--------------	---

void setTo ([Address](#) *value*)

Sets the value of the to property.

Parameters:

<i>value</i>	allowed object is Address
--------------	---

receiver	Email address of the receiver of the email.	String

Member Function Documentation

[Address](#) getBcc ()

Gets the value of the bcc property.

Returns:

possible object is [Address](#)

[Address](#) getCc ()

Gets the value of the cc property.

Returns:

possible object is [Address](#)

java.lang.String getFrom ()

Gets the value of the from property.

Returns:

possible object is [java.lang.String](#)

java.lang.String getReceiver ()

Gets the value of the receiver property.

Returns:

possible object is [java.lang.String](#)

[Address](#) getReplyTo ()

Gets the value of the replyTo property.

Returns:

possible object is [Address](#)

[Address](#) getTo ()

Gets the value of the to property.

Returns:

possible object is [Address](#)

void setBcc ([Address](#) value)

Sets the value of the bcc property.

Parameters:

<i>value</i>	allowed object is Address
--------------	---

void setCc ([Address](#) value)

Sets the value of the cc property.

Parameters:

<i>value</i>	allowed object is Address
--------------	---

void setFrom (java.lang.String value)

Sets the value of the from property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setReceiver (java.lang.String *value*)

Sets the value of the receiver property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setReplyTo ([Address](#) *value*)

Sets the value of the replyTo property.

Parameters:

<i>value</i>	allowed object is Address
--------------	---

void setTo ([Address](#) *value*)

Sets the value of the to property.

Parameters:

<i>value</i>	allowed object is Address
--------------	---

ApiScope Class Reference

Detailed Description

The API currently covers the following areas:

Login and Logout APIs:

- Login
- Logout
- [Login Customer](#)
- [Logout Customer](#)

- Login Customer using Single Sign-On:
 - [Single Sign-On using SAML](#)
 - [Single Sign-On using SAML bearer token](#)

Interaction:

- Cases:
 - [Get custom attributes for case resource](#)
 - [Get cases by IDs](#)
 - [Search for cases](#)
 - [Edit case](#)
 - [Change customer for case](#)
 - [Close case](#)

- Activities:
 - [Get activities by IDs](#)
 - [Search for activities](#)
 - [Get attachments of an activity](#)
 - [Download an activity attachment](#)
 - [Change Customer of Activities](#)
 - [Compose and Save Email Activity](#)
 - [Create Incoming Email Activity](#)
 - [Compose and send email activity](#)
 - [Compose and send-complete email activity](#)
 - [Edit Activity](#)
 - [Pull activities from queues](#)
 - [Pick Activities from users and queues](#)
 - [Transfer Activities to User](#)
 - [Transfer Activities to Queue](#)
 - [Transfer Activities to Department](#)
 - [Change Case of Activities](#)
 - [Complete Activities](#)

- Customers:

- [Get attributes for customer resource](#)
- [Get customers by IDs](#)
- [Search for customers](#)
- [Create Individual Customer](#)
- [Create Group Customer](#)
- [Create Corporate Customer](#)
- [Edit Individual Customer](#)
- [Edit Group Customer](#)
- [Edit Corporate Customer](#)
- [Create customer grants](#)
- [Get customer grants](#)
- [Delete customer grants](#)

•

Customer Portal APIs:

- Cases:
 - [Get case by ID](#)
 - [Search for cases](#)

Detailed Description

Article Schema

This schema contains [Article](#) type details.

XML Schema File

model/v12/xsd/kb/article.xsd

Name	Description	Type
id	Article ID of the requested	Long

	article	
alternateId	Readable Article Id of requested article	String
link	Relational links self, topics, classifications, related articles, cases, questions	Link
unlink	Relational links to remove related articles	Link
lastModified	Last modification details	Created
created	Creation details of the article	Created
suggestionState	State of suggested article	String
reviewStage	Review Stage details of the article	ReviewStage
folder	ID, name and self link of the parent folder	Folder
lock	User details of locked article	Lock
language	ID, code, label of language	Language
department	ID, name and link of the department	Department
macro	Name, description, defaultarticle and defaultvalue of macro	Macro
relatedQuestions	Count and link of related questions	RelatedQuestions
linkAlias	Link alias of the article	String
notes	Notes details related to article	Notes
versions	Count and details of the Versions	Versions
customAttributes	Custom attributes of the article	CustomAttributes

Member Function Documentation

`java.lang.String getAlternateId ()`

Gets the value of the alternateId property.

Returns:

possible object is [java.lang.String](#)

[DateAndTime](#) `getCreated ()`

Gets the value of the created property.

Returns:

possible object is [DateAndTime](#)

[CustomAttributes](#) `getCustomAttributes ()`

Gets the value of the customAttributes property.

Returns:

possible object is [CustomAttributes](#)

[Department](#) getDepartment ()

Gets the value of the department property.

Returns:

possible object is [Department](#)

[Folder](#) getFolder ()

Gets the value of the folder property.

Returns:

possible object is [Folder](#)

long getId ()

Gets the value of the id property.

Returns:

possible object is [Long](#)

[Language](#) getLanguage ()

Gets the value of the language property.

Returns:

possible object is [Language](#)

[DateAndTime](#) getLastModified ()

Gets the value of the lastModified property.

Returns:

possible object is [DateAndTime](#)

java.util.List<[Link](#)> getLink ()

Gets the value of the link property.

This accessor method returns a reference to the live list, not a snapshot. Therefore any modification you make to the returned list will be present inside the JAXB object. This is why there is not a `set` method for the link property.

For example, to add a new item, do as follows:

```
getLink().add(newItem);
```

Objects of the following type(s) are allowed in the list [Link](#)

java.lang.String getLinkAlias ()

Gets the value of the linkAlias property.

Returns:

possible object is [java.lang.String](#)

[Lock](#) getLock ()

Gets the value of the lock property.

Returns:

possible object is [Lock](#)

[Macro](#) getMacro ()

Gets the value of the macro property.

Returns:

possible object is [Macro](#)

[Notes](#) getNotes ()

Gets the value of the notes property.

Returns:

possible object is [Notes](#)

[RelatedQuestions](#) getRelatedQuestions ()

Gets the value of the relatedQuestions property.

Returns:

possible object is [RelatedQuestions](#)

[ReviewStage](#) getReviewStage ()

Gets the value of the reviewStage property.

Returns:

possible object is [ReviewStage](#)

java.lang.String getSuggestionState ()

Gets the value of the suggestionState property.

Returns:

possible object is [java.lang.String](#)

java.util.List<[Link](#)> getUnlink ()

Gets the value of the unlink property.

This accessor method returns a reference to the live list, not a snapshot. Therefore any modification you make to the returned list will be present inside the JAXB object. This is why there is not a `set` method for the unlink property.

For example, to add a new item, do as follows:

```
getUnlink().add(newItem);
```

Objects of the following type(s) are allowed in the list [Link](#)

[Versions](#) getVersions ()

Gets the value of the versions property.

Returns:

possible object is [Versions](#)

void setAlternateId (java.lang.String value)

Sets the value of the alternateId property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setCreated ([DateAndTime](#) *value*)

Sets the value of the created property.

Parameters:

<i>value</i>	allowed object is DateAndTime
--------------	---

void setCustomAttributes ([CustomAttributes](#) *value*)

Sets the value of the customAttributes property.

Parameters:

<i>value</i>	allowed object is CustomAttributes
--------------	--

void setDepartment ([Department](#) *value*)

Sets the value of the department property.

Parameters:

<i>value</i>	allowed object is Department
--------------	--

void setFolder ([Folder](#) *value*)

Sets the value of the folder property.

Parameters:

<i>value</i>	allowed object is Folder
--------------	--

void setId (long *value*)

Sets the value of the id property.

Parameters:

<i>value</i>	allowed object is Long
--------------	--

void setLanguage ([Language](#) *value*)

Sets the value of the language property.

Parameters:

<i>value</i>	allowed object is Language
--------------	--

void setLastModified ([DateAndTime](#) *value*)

Sets the value of the lastModified property.

Parameters:

<i>value</i>	allowed object is DateAndTime
--------------	---

void setLinkAlias (java.lang.String *value*)

Sets the value of the linkAlias property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setLock ([Lock](#) value)

Sets the value of the lock property.

Parameters:

<i>value</i>	allowed object is Lock
--------------	--

void setMacro ([Macro](#) value)

Sets the value of the macro property.

Parameters:

<i>value</i>	allowed object is Macro
--------------	---

void setNotes ([Notes](#) value)

Sets the value of the notes property.

Parameters:

<i>value</i>	allowed object is Notes
--------------	---

void setRelatedQuestions ([RelatedQuestions](#) value)

Sets the value of the relatedQuestions property.

Parameters:

<i>value</i>	allowed object is RelatedQuestions
--------------	--

void setReviewStage ([ReviewStage](#) value)

Sets the value of the reviewStage property.

Parameters:

<i>value</i>	allowed object is ReviewStage
--------------	---

void setSuggestionState (java.lang.String value)

Sets the value of the suggestionState property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setVersions ([Versions](#) value)

Sets the value of the versions property.

Parameters:

<i>value</i>	allowed object is Versions
--------------	--

ArticleOrder Class Reference

Public Member Functions

- [Articles](#) `getBottomList ()`
 - [Articles](#) `getTopList ()`
 - void `setBottomList (Articles value)`
 - void `setTopList (Articles value)`
-

Detailed Description

ArticleOrder Schema

This schema contains [ArticleOrder](#) type details.

XML Schema File

model/v12/xsd/kb/topic.xsd

Name	Description	Type
topList	contains an ordered list of articles (only id and self link) that belong to the top of the list of articles in the topic	Articles
bottomList	contains an ordered list of articles (only id and self link) that belong to the bottom of the list of articles in the topic	Articles

Member Function Documentation

[Articles](#) `getBottomList ()`

Gets the value of the bottomList property.

Returns:

possible object is [Articles](#)

[Articles](#) `getTopList ()`

Gets the value of the topList property.

Returns:

possible object is [Articles](#)

void setBottomList ([Articles](#) value)

Sets the value of the bottomList property.

Parameters:

<i>value</i>	allowed object is Articles
--------------	--

void setTopList ([Articles](#) value)

Sets the value of the topList property.

Parameters:

<i>value</i>	allowed object is Articles
--------------	--

Articles Schema

This schema contains [Articles](#) type details.

XML Schema File

model/v12/xsd/kb/article.xsd

Name	Description	Type
count	Count of articles	Int
link	self link	Link
paginationInfo	Pagination details of articles	PaginationInfo
article	Article details .	Article

Member Function Documentation

java.util.List<[Article](#)> [getArticle](#) ()

Gets the value of the article property.

This accessor method returns a reference to the live list, not a snapshot. Therefore any modification you make to the returned list will be present inside the JAXB object. This is why there is not a `set` method for the article property.

For example, to add a new item, do as follows:

```
getArticle() .add(newItem);
```

Objects of the following type(s) are allowed in the list [Article](#)

int [getCount](#) ()

Gets the value of the count property.

Returns:

possible object is [Integer](#)

[Link](#) getLink ()

Gets the value of the link property.

Returns:

possible object is [Link](#)

[PaginationInfo](#) getPaginationInfo ()

Gets the value of the paginationInfo property.

Returns:

possible object is [PaginationInfo](#)

void setCount (int *value*)

Sets the value of the count property.

Parameters:

<i>value</i>	allowed object is Integer
--------------	---

void setLink ([Link](#) *value*)

Sets the value of the link property.

Parameters:

<i>value</i>	allowed object is Link
--------------	--

void setPaginationInfo ([PaginationInfo](#) *value*)

Sets the value of the paginationInfo property.

Parameters:

<i>value</i>	allowed object is PaginationInfo
--------------	--

Article Template Schema

This schema contains [Article](#) Template details.

XML Schema File

model/v12/xsd/kb/article_template.xsd

Name	Description	Type
id	ID of the Article Template	Long
link	self link	Link
department	ID, name and link of the department	Department
language	ID, code, label of language	Language
articleType	Details of ArticleType	ArticleType
name	Name of the Article Template	String
description	Description of the article Template	String
content	Content of the article Template	String

Member Function Documentation

[ArticleType](#) getArticleType ()

Gets the value of the articleType property.

Returns:

possible object is [ArticleType](#)

java.lang.String getContent ()

Gets the value of the content property.

Returns:

possible object is [java.lang.String](#)

[Department](#) getDepartment ()

Gets the value of the department property.

Returns:

possible object is [Department](#)

java.lang.String getDescription ()

Gets the value of the description property.

Returns:

possible object is [java.lang.String](#)

long getId ()

Gets the value of the id property.

Returns:

possible object is [Long](#)

[Language](#) getLanguage ()

Gets the value of the language property.

Returns:

possible object is [Language](#)

[Link](#) getLink ()

Gets the value of the link property.

Returns:

possible object is [Link](#)

java.lang.String getName ()

Gets the value of the name property.

Returns:

possible object is [java.lang.String](#)

void setArticleType ([ArticleType](#) value)

Sets the value of the articleType property.

Parameters:

<i>value</i>	allowed object is ArticleType
--------------	---

void setContent (java.lang.String *value*)

Sets the value of the content property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setDepartment ([Department](#) *value*)

Sets the value of the department property.

Parameters:

<i>value</i>	allowed object is Department
--------------	--

void setDescription (java.lang.String *value*)

Sets the value of the description property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setId (long *value*)

Sets the value of the id property.

Parameters:

<i>value</i>	allowed object is Long
--------------	--

void setLanguage ([Language](#) *value*)

Sets the value of the language property.

Parameters:

<i>value</i>	allowed object is Language
--------------	--

void setLink ([Link](#) *value*)

Sets the value of the link property.

Parameters:

<i>value</i>	allowed object is Link
--------------	--

void setName (java.lang.String *value*)

Sets the value of the name property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

Member Function Documentation

[ArticleTemplates](#) getArticleTemplates ()

Gets the value of the articleTemplates property.

Returns:

possible object is [ArticleTemplates](#)

[Department](#) getDepartment ()

Gets the value of the department property.

Returns:

possible object is [Department](#)

java.lang.String getDescription ()

Gets the value of the description property.

Returns:

possible object is [java.lang.String](#)

long getId ()

Gets the value of the id property.

Returns:

possible object is [Long](#)

[Language](#) getLanguage ()

Gets the value of the language property.

Returns:

possible object is [Language](#)

java.lang.String getName ()

Gets the value of the name property.

Returns:

possible object is [java.lang.String](#)

Boolean isDisplayable ()

Gets the value of the displayable property.

Returns:

possible object is [Boolean](#)

Boolean isSearchable ()

Gets the value of the searchable property.

Returns:

possible object is [Boolean](#)

void setArticleTemplates ([ArticleTemplates](#) value)

Sets the value of the articleTemplates property.

Parameters:

<i>value</i>	allowed object is ArticleTemplates
--------------	--

void setDepartment ([Department](#) *value*)

Sets the value of the department property.

Parameters:

<i>value</i>	allowed object is Department
--------------	--

void setDescription (java.lang.String *value*)

Sets the value of the description property.

Parameters:

--------------	--

void setDisplayable (Boolean *value*)

Sets the value of the displayable property.

Parameters:

<i>value</i>	allowed object is Boolean
--------------	---

void setId (long *value*)

Sets the value of the id property.

Parameters:

<i>value</i>	allowed object is Long
--------------	--

void setLanguage ([Language](#) *value*)

Sets the value of the language property.

Parameters:

<i>value</i>	allowed object is Language
--------------	--

void setName (java.lang.String *value*)

Sets the value of the name property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setSearchable (Boolean *value*)

Sets the value of the searchable property.

Parameters:

<i>value</i>	allowed object is Boolean
--------------	---

Detailed Description

Article Types Schema

This schema contains [Article](#) Types details.

XML Schema File

model/v12/xsd/kb/article_template.xsd

Name	Description	Type
link	self link	Link
department	ID, name and link of the department	Department
language	ID, code, label of language	Language
articleType	A list of one or more ArticleType instances	ArticleType

Member Function Documentation

java.util.List<[ArticleType](#)> [getArticleType](#) ()

Gets the value of the articleType property.

This accessor method returns a reference to the live list, not a snapshot. Therefore any modification you make to the returned list will be present inside the JAXB object. This is why there is not a set method for the articleType property.

For example, to add a new item, do as follows:

```
getArticleType ().add (newItem) ;
```

Objects of the following type(s) are allowed in the list [ArticleType](#)

[Department](#) [getDepartment](#) ()

Gets the value of the department property.

Returns:

possible object is [Department](#)

[Language](#) getLanguage ()

Gets the value of the language property.

Returns:

possible object is [Language](#)

[Link](#) getLink ()

Gets the value of the link property.

Returns:

possible object is [Link](#)

void setDepartment ([Department](#) value)

Sets the value of the department property.

Parameters:

<i>value</i>	allowed object is Department
--------------	--

void setLanguage ([Language](#) value)

Sets the value of the language property.

Parameters:

<i>value</i>	allowed object is Language
--------------	--

void setLink ([Link](#) value)

Sets the value of the link property.

Parameters:

<i>value</i>	allowed object is Link
--------------	--

Name	Description	Type
user	Information about the user to whom the activity is assigned.	User
activityFolder	Localized value of status of the activity.	Folder
isPinned	Indicates whether the activity is pinned.	Boolean
isLocked	Indicates whether the activity is locked.	Boolean

Member Function Documentation

[Folder](#) getActivityFolder ()

Gets the value of the activityFolder property.

Returns:

possible object is [Folder](#)

[User](#) getUser ()

Gets the value of the user property.

Returns:

possible object is [User](#)

Boolean isLocked ()

Gets the value of the isLocked property.

Returns:

possible object is [Boolean](#)

Boolean isPinned ()

Gets the value of the isPinned property.

Returns:

possible object is [Boolean](#)

void setActivityFolder ([Folder](#) value)

Sets the value of the activityFolder property.

Parameters:

<i>value</i>	allowed object is Folder
--------------	--

void setIsLocked (Boolean value)

Sets the value of the isLocked property.

Parameters:

<i>value</i>	allowed object is Boolean
--------------	---

void setIsPinned (Boolean value)

Sets the value of the isPinned property.

Parameters:

<i>value</i>	allowed object is Boolean
--------------	---

void setUser ([User](#) value)

Sets the value of the user property.

Parameters:

<i>value</i>	allowed object is User
--------------	--

contentId	Cid of the inline attachment	String
contentUrl	Url of the content	String
content	content of the attachment	String

Member Function Documentation

java.lang.String getCharset ()

Gets the value of the charset property.

Returns:

possible object is [java.lang.String](#)

java.lang.String getContent ()

Gets the value of the content property.

Returns:

possible object is [java.lang.String](#)

java.lang.String getContentId ()

Gets the value of the contentId property.

Returns:

possible object is [java.lang.String](#)

java.lang.String getContentType ()

Gets the value of the contentType property.

Returns:

possible object is [java.lang.String](#)

java.lang.String getContentUrl ()

Gets the value of the contentUrl property.

Returns:

possible object is [java.lang.String](#)

java.lang.String getEncodingType ()

Gets the value of the encodingType property.

Returns:

possible object is [java.lang.String](#)

java.lang.String getFileName ()

Gets the value of the fileName property.

Returns:

possible object is [java.lang.String](#)

long getId ()

Gets the value of the id property.

Returns:

possible object is [Long](#)

[Link](#) getLink ()

Gets the value of the link property.

Returns:

possible object is [Link](#)

Long getSize ()

Gets the value of the size property.

Returns:

possible object is [Long](#)

Boolean isIsBlocked ()

Gets the value of the isBlocked property.

Returns:

possible object is [Boolean](#)

Boolean isIsInline ()

Gets the value of the isInline property.

Returns:

possible object is [Boolean](#)

void setCharset (java.lang.String value)

Sets the value of the charset property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setContent (java.lang.String value)

Sets the value of the content property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setContentId (java.lang.String value)

Sets the value of the contentId property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setContentType (java.lang.String value)

Sets the value of the contentType property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setContentUrl (java.lang.String value)

Sets the value of the contentUrl property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setEncodingType (java.lang.String value)

Sets the value of the encodingType property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setFileName (java.lang.String value)

Sets the value of the fileName property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setId (long value)

Sets the value of the id property.

Parameters:

<i>value</i>	allowed object is Long
--------------	--

void setIsBlocked (Boolean value)

Sets the value of the isBlocked property.

Parameters:

<i>value</i>	allowed object is Boolean
--------------	---

void setIsInline (Boolean value)

Sets the value of the isInline property.

Parameters:

<i>value</i>	allowed object is Boolean
--------------	---

void setLink ([Link](#) value)

Sets the value of the link property.

Parameters:

<i>value</i>	allowed object is Link
--------------	--

void setSize (Long value)

Sets the value of the size property.

Parameters:

<i>value</i>	allowed object is Long
--------------	--

Member Function Documentation

java.lang.String getContentFetchOption ()

Gets the value of the contentFetchOption property.

Returns:

possible object is [java.lang.String](#)

java.lang.String getContentUrl ()

Gets the value of the contentUrl property.

Returns:

possible object is [java.lang.String](#)

[DateAndTime](#) getCreated ()

Gets the value of the created property.

Returns:

possible object is [DateAndTime](#)

java.lang.String getFilePath ()

Gets the value of the filePath property.

Returns:

possible object is [java.lang.String](#)

long getId ()

Gets the value of the id property.

Returns:

possible object is [Long](#)

[Link](#) getLink ()

Gets the value of the link property.

Returns:

possible object is [Link](#)

java.lang.String getLoginName ()

Gets the value of the loginName property.

Returns:

possible object is [java.lang.String](#)

java.lang.String getLoginPassword ()

Gets the value of the loginPassword property.

Returns:

possible object is [java.lang.String](#)

java.lang.String getName ()

Gets the value of the name property.

Returns:

possible object is [java.lang.String](#)

java.lang.String getType ()

Gets the value of the type property.

Returns:

possible object is [java.lang.String](#)

void setContentFetchOption (java.lang.String value)

Sets the value of the contentFetchOption property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setContentUrl (java.lang.String value)

Sets the value of the contentUrl property.

Parameters:

<i>value</i>	allowed object is java.lang.String

java.lang.String getCharset ()

Gets the value of the charset property.

Returns:

possible object is [java.lang.String](#)

java.lang.String getContent ()

Gets the value of the content property.

Returns:

possible object is [java.lang.String](#)

java.lang.String getContentId ()

Gets the value of the contentId property.

Returns:

possible object is [java.lang.String](#)

java.lang.String getContentType ()

Gets the value of the contentType property.

Returns:

possible object is [java.lang.String](#)

java.lang.String getContentUrl ()

Gets the value of the contentUrl property.

Returns:

possible object is [java.lang.String](#)

java.lang.String getEncodingType ()

Gets the value of the encodingType property.

Returns:

possible object is [java.lang.String](#)

java.lang.String getFileName ()

Gets the value of the fileName property.

Returns:

possible object is [java.lang.String](#)

long getId ()

Gets the value of the id property.

Returns:

possible object is [Long](#)

[Link](#) getLink ()

Gets the value of the link property.

Returns:

possible object is [Link](#)

Long getSize ()

Gets the value of the size property.

Returns:

possible object is [Long](#)

Boolean isIsBlocked ()

Gets the value of the isBlocked property.

Returns:

possible object is [Boolean](#)

Boolean isIsInline ()

Gets the value of the isInline property.

Returns:

possible object is [Boolean](#)

void setCharset (java.lang.String value)

Sets the value of the charset property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setContent (java.lang.String value)

Sets the value of the content property.

Parameters:

<i>value</i>	allowed object is java.lang.String

AttachmentsCommonInfoPage Class Reference

Detailed Description

Supported values of some Common Query Parameters in Attachment Resource APIs

NOTE: each *common parameter* described below is not necessarily supported by all Attachment APIs. Therefore, first refer to specific API documentation to see which *common parameters* that API supports.

Values of \$attribute common parameter supported by Attachment Resource

Use `$attribute` to request additional attributes/elements of resource representation, beyond those always returned by server. The value of `$attribute` must be a comma separated list of attribute names. For example,

GET

```
.../interaction/activity/1000/attachment/1011?$attribute=contentUrl
```

```
GET .../interaction/activity/1000/attachment/1011?$attribute=all
```

Name	Description	Schema/type returned by server
all	This is a special keyword that prompts server to return all available resource attributes	N/A
contentUrl	URL which can be used to download the content of the attachment will be returned. This only exists temporarily on the server. The customer should immediately download the attachment content if needed. The attachment can be retrieved only once as it is deleted from the server after download.	String

Summary attributes of Attachment Resource

Attachment Resource always returns `<attachments>` representation, that contains one or more `<attachment>` representations.

Attachment summary

Name	Description	Schema/type
id	Attachment ID	Long
link	Self link that can be used to retrieve this attachment	Link Schema
fileName	File name of the attachment	String
contentType	Mime-type of the attachment	String
size	Attachment size in bytes	Long
encodingType	Content-transfer-encoding of the attachment	String
charset	character-set encoding of the attachment	String
isBlocked	flag to indicate if the attachment is blocked	Boolean

Detailed Description

Supported values of some Common Query Parameters in Attachment Resource APIs

NOTE: each *common parameter* described below is not necessarily supported by all Attachment APIs. Therefore, first refer to specific API documentation to see which *common parameters* that API supports.

Values of \$attribute common parameter supported by Attachment Resource

Use `$attribute` to request additional attributes/elements of resource representation, beyond those always returned by server. The value of `$attribute` must be a comma separated list of attribute names. For example,

```
GET
.../context/interaction/activity/1000/attachment/1006?$attribute=payload
```

```
GET
.../context/interaction/activity/1000//attachment/1006?$attribute=contentUrl
```

```
GET
.../context/interaction/activity/1000//attachment/1006?$attribute=all
```

Name	Description	Schema/type returned by server
all	This is a special keyword that prompts server to return all available resource attributes	N/A
contentUrl	URL which can be used to download the content of the attachment will be returned. This only exists temporarily on the server. The customer should immediately download the attachment content if needed. The attachment can be retrieved only once as it is deleted from the server after download.	String

Summary attributes of Attachment Resource

Attachment Resource always returns <attachments> representation, that contains one or more <attachment> representations.

Attachment summary

Name	Description	Schema/type
id	Attachment ID	Long
link	Self link that can be used to retrieve this attachment	Link Schema
fileName	File name of the attachment	String
contentType	Mime-type of the attachment	String
size	Attachment size in bytes	Long
encodingType	Content-transfer-encoding of the attachment	String
charset	character-set encoding of the attachment	String
isBlocked	flag to indicate if the attachment is blocked	Boolean

Detailed Description

Attribute Schema

This schema contains [Attribute](#) type details.

XML Schema File

model/v12/xsd/common/attribute.xsd

Name	Description	Type
name	Name of custom attribute or values like 'type'	String
custom	Indicates custom attribute	Boolean
dataSize	Size of data	Long
dataType	Type of data (integer, string or stringList)	String
defaultValue	Allowed when dataType is integer or string	String
options	Allowed when dataType is stringList	Options
attribute	Attribute details.	Attribute

Member Function Documentation

java.util.List<[Attribute](#)> [getAttribute](#) ()

Gets the value of the attribute property.

This accessor method returns a reference to the live list, not a snapshot. Therefore any modification you make to the returned list will be present inside the JAXB object. This is why there is not a `set` method for the attribute property.

For example, to add a new item, do as follows:

```
getAttribute().add(newItem);
```

Objects of the following type(s) are allowed in the list [Attribute](#)

Long getDataSize ()

Gets the value of the `dataSize` property.

Returns:

possible object is [Long](#)

java.lang.String getDataType ()

Gets the value of the `dataType` property.

Returns:

possible object is [java.lang.String](#)

java.lang.String getDefaultValue ()

Gets the value of the `defaultValue` property.

Returns:

possible object is [java.lang.String](#)

java.lang.String getName ()

Gets the value of the `name` property.

Returns:

possible object is [java.lang.String](#)

[Options](#) getOptions ()

Gets the value of the `options` property.

Returns:

possible object is [Options](#)

boolean isCustom ()

Gets the value of the `custom` property.

Returns:

possible object is [Boolean](#)

void setCustom (boolean value)

Sets the value of the `custom` property.

Parameters:

<i>value</i>	allowed object is Boolean
--------------	---

void setDataSize (Long value)

Sets the value of the `dataSize` property.

Parameters:

<i>value</i>	allowed object is Long
--------------	--

void setDataType (java.lang.String *value*)

Sets the value of the dataType property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setDefaultValue (java.lang.String *value*)

Sets the value of the defaultValue property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setName (java.lang.String *value*)

Sets the value of the name property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setOptions ([Options](#) *value*)

Sets the value of the options property.

Parameters:

<i>value</i>	allowed object is Options
--------------	---

Name	Description	Type
sourceId	ID of the auto created topic	Long
link	Relational links to the folder used as a auto created topic	Link

Member Function Documentation

[Link](#) `getLink ()`

Gets the value of the link property.

Returns:

possible object is [Link](#)

Long `getSourceId ()`

Gets the value of the sourceId property.

Returns:

possible object is [Long](#)

void `setLink (Link value)`

Sets the value of the link property.

Parameters:

<i>value</i>	allowed object is Link
--------------	--

void `setSourceId (Long value)`

Sets the value of the sourceId property.

Parameters:

<i>value</i>	allowed object is Long
--------------	--

Detailed Description

CallInfo Schema

This schema contains metadata about the call. It is populated from the input URL and its parameters.

XML Schema File

model/v3/xsd/common.xsd

Name	Description	Type
dataVersion	The web services data model version. It is "3.0" for v11.	string
duration	Milliseconds used by the call on the server.	string containing a long
httpStatus	The HTTP status code, such as "200".	string
message	If status is "error", this contains the error message. Otherwise it is empty.	string

portalId	The portal as specified in the parameters, or in the URL itself.	string
resource	The resource type from the URL, such as "article".	string
resourceId	The resource ID mentioned in the URL, if any.	string
redirectUrl	One-time use URL that can be used to download attachments and other files.	string
status	This will contain "success" or "error".	string
subResource	A subresource, if any, mentioned in the URL. An example is "attachment".	string
timestamp	The timestamp when the server received the query.	string
userType	The userType ("customer", "agent", or in rare cases "unknown") provided by the client.	UsertypeType
wsVersion	The web services API version. It is "11.0" for v11.	string

Member Function Documentation

`java.lang.String getDataVersion ()`

Gets the value of the dataVersion property.

Returns:

possible object is [java.lang.String](#)

`java.lang.String getDuration ()`

Gets the value of the duration property.

Returns:

possible object is [java.lang.String](#)

`java.lang.String getHttpStatus ()`

Gets the value of the httpStatus property.

Returns:

possible object is [java.lang.String](#)

`java.lang.String getMessage ()`

Gets the value of the message property.

Returns:

possible object is [java.lang.String](#)

java.lang.String getPortalId ()

Gets the value of the portalId property.

Returns:

possible object is [java.lang.String](#)

java.lang.String getRedirectUrl ()

Gets the value of the redirectUrl property.

Returns:

possible object is [java.lang.String](#)

java.lang.String getResource ()

Gets the value of the resource property.

Returns:

possible object is [java.lang.String](#)

java.lang.String getResourceId ()

Gets the value of the resourceId property.

Returns:

possible object is [java.lang.String](#)

java.lang.String getStatus ()

Gets the value of the status property.

Returns:

possible object is [java.lang.String](#)

java.lang.String getSubResource ()

Gets the value of the subResource property.

Returns:

possible object is [java.lang.String](#)

java.lang.String getTimestamp ()

Gets the value of the timestamp property.

Returns:

possible object is [java.lang.String](#)

[UsertypeType](#) getUserType ()

Gets the value of the userType property.

Returns:

possible object is [UsertypeType](#)

java.lang.String getWsVersion ()

Gets the value of the wsVersion property.

Returns:

possible object is [java.lang.String](#)

void setDataVersion (java.lang.String value)

Sets the value of the dataVersion property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setDuration (java.lang.String value)

Sets the value of the duration property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setHttpStatus (java.lang.String value)

Sets the value of the httpStatus property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setMessage (java.lang.String value)

Sets the value of the message property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setPortalId (java.lang.String value)

Sets the value of the portalId property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setRedirectUrl (java.lang.String value)

Sets the value of the redirectUrl property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setResource (java.lang.String value)

Sets the value of the resource property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setResourceId (java.lang.String value)

Sets the value of the resourceId property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setStatus (java.lang.String value)

Sets the value of the status property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setSubResource (java.lang.String value)

Sets the value of the subResource property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setTimestamp (java.lang.String value)

Sets the value of the timestamp property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setUserType ([UserTypeType](#) value)

Sets the value of the userType property.

Parameters:

<i>value</i>	allowed object is UserTypeType
--------------	--

void setWsVersion (java.lang.String value)

Sets the value of the wsVersion property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

subject	Subject of the case	String
originatingChannel	Originating Channel of the case	L10NString
created	Creation details of the case	DateAndUser
description	Description of the case	String
solution	Description of the solution to the case	String
userLastWorked	Details of the last user or agent who worked on any activity of this case	User
customAttributes	Name and value of all the custom attributes configured for the Case Object	CustomAttributes

Member Function Documentation

[Activities](#) getActivities ()

Gets the value of the activities property.

Returns:

possible object is [Activities](#)

[DateAndUser](#) getCreated ()

Gets the value of the created property.

Returns:

possible object is [DateAndUser](#)

[CustomAttributes](#) getCustomAttributes ()

Gets the value of the customAttributes property.

Returns:

possible object is [CustomAttributes](#)

[Customer](#) getCustomer ()

Gets the value of the customer property.

Returns:

possible object is [Customer](#)

[Department](#) getDepartment ()

Gets the value of the department property.

Returns:

possible object is [Department](#)

java.lang.String getDescription ()

Gets the value of the description property.

Returns:

possible object is [java.lang.String](#)

java.lang.String getDueDate ()

Gets the value of the dueDate property.

Returns:

possible object is [java.lang.String](#)

long getId ()

Gets the value of the id property.

Returns:

possible object is [Long](#)

[DateAndUser](#) getLastModified ()

Gets the value of the lastModified property.

Returns:

possible object is [DateAndUser](#)

[Link](#) getLink ()

Gets the value of the link property.

Returns:

possible object is [Link](#)

[L10NString](#) getOriginatingChannel ()

Gets the value of the originatingChannel property.

Returns:

possible object is [L10NString](#)

[Owner](#) getOwner ()

Gets the value of the owner property.

Returns:

possible object is [Owner](#)

[L10NString](#) getSeverity ()

Gets the value of the severity property.

Returns:

possible object is [L10NString](#)

java.lang.String getSolution ()

Gets the value of the solution property.

Returns:

possible object is [java.lang.String](#)

[L10NString](#) getStatus ()

Gets the value of the status property.

Returns:

possible object is [L10NString](#)

java.lang.String getSubject ()

Gets the value of the subject property.

Returns:

possible object is [java.lang.String](#)

[User](#) getUserLastWorked ()

Gets the value of the userLastWorked property.

Returns:

possible object is [User](#)

void setActivities ([Activities](#) value)

Sets the value of the activities property.

Parameters:

<i>value</i>	allowed object is Activities
--------------	--

void setCreated ([DateAndUser](#) value)

Sets the value of the created property.

Parameters:

<i>value</i>	allowed object is DateAndUser
--------------	---

void setCustomAttributes ([CustomAttributes](#) value)

Sets the value of the customAttributes property.

Parameters:

<i>value</i>	allowed object is CustomAttributes
--------------	--

void setCustomer ([Customer](#) value)

Sets the value of the customer property.

Parameters:

<i>value</i>	allowed object is Customer
--------------	--

void setDepartment ([Department](#) value)

Sets the value of the department property.

Parameters:

<i>value</i>	allowed object is Department
--------------	--

void setDescription ([java.lang.String](#) value)

Sets the value of the description property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setDueDate ([java.lang.String](#) value)

Sets the value of the dueDate property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setId ([long](#) value)

Sets the value of the id property.

Parameters:

<i>value</i>	allowed object is Long
--------------	--

void setLastModified ([DateAndUser](#) value)

Sets the value of the lastModified property.

Parameters:

<i>value</i>	allowed object is DateAndUser
--------------	---

void setLink ([Link](#) value)

Sets the value of the link property.

Parameters:

<i>value</i>	allowed object is Link
--------------	--

void setOriginatingChannel ([L10NString](#) value)

Sets the value of the originatingChannel property.

Parameters:

<i>value</i>	allowed object is L10NString
--------------	--

void setOwner ([Owner](#) value)

Sets the value of the owner property.

Parameters:

<i>value</i>	allowed object is Owner
--------------	---

void setSeverity ([L10NString](#) value)

Sets the value of the severity property.

Parameters:

<i>value</i>	allowed object is L10NString
--------------	--

void setSolution (java.lang.String *value*)

Sets the value of the solution property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setStatus ([L10NString](#) *value*)

Sets the value of the status property.

Parameters:

<i>value</i>	allowed object is L10NString
--------------	--

void setSubject (java.lang.String *value*)

Sets the value of the subject property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setUserLastWorked ([User](#) *value*)

Sets the value of the userLastWorked property.

Parameters:

<i>value</i>	allowed object is User
--------------	--

Detailed Description

Case Schema

This schema contains [Case](#) type details.

XML Schema File

model/v15/xsd/interaction/case.xsd

Name	Description	Type
id	Case ID of the requested case	Long
link	self link	Link
activities	activity link to fetch activities of the case	Activities
department	Department of the case	Department
status	Status of the case	L10NString
lastModified	Last modification details	DateAndUser
dueDate	Due date of the case	DateTime
owner	Owner details of the case	Owner
customer	Details of the customer associated with the case	Customer
severity	Severity of the case	L10NString
subject	Subject of the case	String
originatingChannel	Originating Channel of the case	L10NString
created	Creation details of the case	DateAndUser
description	Description of the case	String
solution	Description of the solution to the case	String
userLastWorked	Details of the last user or agent who worked on any activity of this case	User
recentActivityDate	Date of creation of most recent activity of the case	DateTime
unreadActivityCount	Number of unread activities in the case	Int
customAttributes	Name and value of all the custom attributes configured for the Case Object	CustomAttributes

Member Function Documentation

[Activities](#) getActivities ()

Gets the value of the activities property.

Returns:

possible object is [Activities](#)

[DateAndUser](#) getCreated ()

Gets the value of the created property.

Returns:

possible object is [DateAndUser](#)

[CustomAttributes](#) getCustomAttributes ()

Gets the value of the customAttributes property.

Returns:

possible object is [CustomAttributes](#)

[Customer](#) getCustomer ()

Gets the value of the customer property.

Returns:

possible object is [Customer](#)

[Department](#) getDepartment ()

Gets the value of the department property.

Returns:

possible object is [Department](#)

java.lang.String getDescription ()

Gets the value of the description property.

Returns:

possible object is [java.lang.String](#)

java.lang.String getDueDate ()

Gets the value of the dueDate property.

Returns:

possible object is [java.lang.String](#)

long getId ()

Gets the value of the id property.

Returns:

possible object is [Long](#)

[DateAndUser](#) getLastModified ()

Gets the value of the lastModified property.

Returns:

possible object is [DateAndUser](#)

[Link](#) getLink ()

Gets the value of the link property.

Returns:

possible object is [Link](#)

[L10NString](#) getOriginatingChannel ()

Gets the value of the originatingChannel property.

Returns:

possible object is [L10NString](#)

[Owner](#) getOwner ()

Gets the value of the owner property.

Returns:

possible object is [Owner](#)

XMLGregorianCalendar getRecentActivityDate ()

Gets the value of the recentActivityDate property.

Returns:

possible object is [XMLGregorianCalendar](#)

[L10NString](#) getSeverity ()

Gets the value of the severity property.

Returns:

possible object is [L10NString](#)

java.lang.String getSolution ()

Gets the value of the solution property.

Returns:

possible object is [java.lang.String](#)

[L10NString](#) getStatus ()

Gets the value of the status property.

Returns:

possible object is [L10NString](#)

java.lang.String getSubject ()

Gets the value of the subject property.

Returns:

possible object is [java.lang.String](#)

Integer getUnreadActivityCount ()

Gets the value of the unreadActivityCount property.

Returns:

possible object is [Integer](#)

[User](#) getUserLastWorked ()

Gets the value of the userLastWorked property.

Returns:

possible object is [User](#)

void setActivities ([Activities](#) value)

Sets the value of the activities property.

Parameters:

<i>value</i>	allowed object is Activities
--------------	--

void setCreated ([DateAndUser](#) value)

Sets the value of the created property.

Parameters:

value	allowed object is DateAndUser
-------	---

void setCustomAttributes ([CustomAttributes](#) value)

Sets the value of the customAttributes property.

Parameters:

value	allowed object is CustomAttributes
-------	--

void setCustomer ([Customer](#) value)

Sets the value of the customer property.

Parameters:

value	allowed object is Customer
-------	--

void setDepartment ([Department](#) value)

Sets the value of the department property.

Parameters:

value	allowed object is Department
-------	--

void setDescription (java.lang.String value)

Sets the value of the description property.

Parameters:

value	allowed object is java.lang.String
-------	--

void setDueDate (java.lang.String value)

Sets the value of the dueDate property.

Parameters:

value	allowed object is java.lang.String
-------	--

void setId (long value)

Sets the value of the id property.

Parameters:

value	allowed object is Long
-------	--

void setLastModified ([DateAndUser](#) value)

Sets the value of the lastModified property.

Parameters:

value	allowed object is DateAndUser
-------	---

void setLink ([Link](#) value)

Sets the value of the link property.

Parameters:

<i>value</i>	allowed object is Link
--------------	--

void setOriginatingChannel ([L10NString](#) *value*)

Sets the value of the originatingChannel property.

Parameters:

<i>value</i>	allowed object is L10NString
--------------	--

void setOwner ([Owner](#) *value*)

Sets the value of the owner property.

Parameters:

<i>value</i>	allowed object is Owner
--------------	---

void setRecentActivityDate ([XMLGregorianCalendar](#) *value*)

Sets the value of the recentActivityDate property.

Parameters:

<i>value</i>	allowed object is XMLGregorianCalendar
--------------	--

void setSeverity ([L10NString](#) *value*)

Sets the value of the severity property.

Parameters:

<i>value</i>	allowed object is L10NString
--------------	--

void setSolution ([java.lang.String](#) *value*)

Sets the value of the solution property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setStatus ([L10NString](#) *value*)

Sets the value of the status property.

Parameters:

<i>value</i>	allowed object is L10NString
--------------	--

void setSubject ([java.lang.String](#) *value*)

Sets the value of the subject property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setUnreadActivityCount ([Integer](#) *value*)

Sets the value of the unreadActivityCount property.

Parameters:

<i>value</i>	allowed object is Integer
--------------	---

void setUserLastWorked ([User](#) value)

Sets the value of the userLastWorked property.

Parameters:

<i>value</i>	allowed object is User
--------------	--

CaseByIDsExamples Class Reference

Detailed Description

Examples for GET Cases by IDs

Example 1 - Get summary attributes for a single case

This example demonstrates the following:

- Retrieving the summary attributes of a single case.

XML

Request

Method	URL
GET	/ws/v12/interaction/case/1000

Request headers

Name	Value
X-egain-session	Valid session ID
Accept	application/xml
Accept-Language	en-US

Response

HTTP/1.1 200 OK

Response headers

Name	Value
X-egain-session	current session ID
Content-Type	application/xml

Response body

```

```

Example 3 - Get summary attributes and additional attributes for multiple cases

This example demonstrates the following:

- Retrieving details of multiple cases.
- Retrieving additional attributes (including custom attribute) along with summary attributes.
- Default sorting - By default, the cases are sorted on case IDs in ascending order.

XML

Request

Method	URL

Example 5 - Get multiple cases sorted on customer name

This example demonstrates the following:

- Retrieving multiple cases.
- Sorting on customer name in the ascending order. Please note that omitting \$order parameter will also result in the same results.

CaseCommonInfoPage Class Reference

Detailed Description

Supported values of some Common Query Parameters that appear in Case Resource APIs

NOTE: each *common parameter* described below is not necessarily supported by all Case APIs. Therefore, first refer to specific API documentation to see which *common parameters* that API supports.

Values of \$attribute common parameter supported by Case Resource

Use `$attribute` to request additional attributes/elements of resource representation, beyond those always returned by server. The value of `$attribute` must be a comma separated list of attribute names. For example,

```
GET .../context/interaction/case/1000?$attribute=created
```

```
GET .../context/interaction/case/1000?$attribute=created,custom.abc
```

```
GET .../context/interaction/case/1000?$attribute=all
```

Name	Description	Schema/type returned by server
all	This is a special keyword that prompts server to return all available resource attributes	N/A
created	Case creation date	DateAndUser
custom.<name>	Name of a custom attribute configured for case object	CustomAttributes

Values of \$sort common parameter supported by Case Resource

Cases returned in server response are sorted based on the attribute supplied under `$sort`. See *Description* column below for specifics.

Name	Description
id	Results are sorted on case IDs

Summary attributes of Case Resource

Case Resource always returns <cases> representation, that contains one or more <case> representations and <paginationInfo> element if applicable.

Case summary

Name	Description	Schema/type
id	Case ID	Long
link	Self link that can be used to retrieve this case	Link
activities	Field holding a link that can be used to retrieve all activities of this case	Activities
status	Status of the case	L10NString
customer	Customer associated with the case (ID, name and self-link). This attribute will be returned only if the case belongs to the logged in customer.	Customer
subject	Case subject	String

CaseCommonInfoPage Class Reference

Detailed Description

Supported values of some Common Query Parameters that appear in Case Resource APIs

NOTE: each *common parameter* described below is not necessarily supported by all Case APIs. Therefore, first refer to specific API documentation to see which *common parameters* that API supports.

Values of \$attribute common parameter supported by Case Resource

Use `$attribute` to request additional attributes/elements of resource representation, beyond those always returned by server. The value of `$attribute` must be a comma separated list of attribute names. For example,

```
GET .../interaction/case/1000?$attribute=description
```

```
GET .../interaction/case/1000?$attribute=created,userLastWorked,custom.abc
```

```
GET .../interaction/case/1000?$attribute=all
```

Name	Description	Schema/type returned by server
all	This is a special keyword that prompts server to return all available resource attributes	N/A
originatingChannel	Name of the activity type through which the case was created	L10NString
created	Case creation details (user and date)	DateAndUser
description	Case description	String
solution	Case solution	String
userLastWorked	Information about the last user who worked on any activity of this case	User
custom.<name>	Name of a custom attribute configured for case object	CustomAttributes

Values of \$sort common parameter supported by Case Resource

Cases returned in server response are sorted based on the attribute supplied under `$sort`. See *Description* column below for specifics.

Name	Description
------	-------------

id	Results are sorted on case IDs
department	Results are sorted on department name of each case
status	Results are sorted on case status value stored in DB, and not on the display value
customer	Results are sorted on customer name associated with each case
custom.<name>	Results are sorted on supplied name of custom attribute of case object

Summary attributes of Case Resource

Case Resource always returns <cases> representation, that contains one or more <case> representations and <paginationInfo> element if applicable.

Case summary

Name	Description	Schema/type
id	Case ID	Long
link	Self link that can be used to retrieve this case	Link
activities	Field holding a link that can be used to retrieve all activities of this case	Activities
department	Department of the case (ID and name)	Department
status	Status of the case	L10NString
lastModified	Details of the last modification of the case (date and user info)	DateAndUser
dueDate	Due date of the case	DateTime
owner	Owner of the case	User
customer	Customer associated with the case (ID, name and self-link)	Customer
severity	Severity of the case	L10NString
subject	Case subject	String

Cases Class Reference

Public Member Functions

- `java.util.List< Case > getCase ()`
 - `Link getLink ()`
 - `PaginationInfo getPaginationInfo ()`
 - `void setLink (Link value)`
 - `void setPaginationInfo (PaginationInfo value)`
-

Detailed Description

Cases Schema

This schema contains [Cases](#) type details.

XML Schema File

model/v12/xsd/interaction/case.xsd

Name	Description	Type
link	self link	Link
case	Case details	Case
paginationInfo	Pagination details of cases	PaginationInfo

Member Function Documentation

`java.util.List<Case> getCase ()`

Gets the value of the case property.

This accessor method returns a reference to the live list, not a snapshot. Therefore any modification you make to the returned list will be present inside the JAXB object. This is why there is not a `set` method for the case property.

For example, to add a new item, do as follows:

```
getCase() .add(newItem);
```

Objects of the following type(s) are allowed in the list [Case](#)

`Link getLink ()`

Gets the value of the link property.

Returns:

possible object is [Link](#)

`PaginationInfo getPaginationInfo ()`

Gets the value of the paginationInfo property.

Returns:

possible object is [PaginationInfo](#)

void setLink ([Link](#) value)

Sets the value of the link property.

Parameters:

<i>value</i>	allowed object is Link
--------------	--

void setPaginationInfo ([PaginationInfo](#) value)

Sets the value of the paginationInfo property.

Parameters:

<i>value</i>	allowed object is PaginationInfo
--------------	--

Cases Class Reference

Public Member Functions

- `java.util.List<Case> getCase ()`
 - `long getCount ()`
 - `Link getLink ()`
 - `PaginationInfo getPaginationInfo ()`
 - `void setCount (long value)`
 - `void setLink (Link value)`
 - `void setPaginationInfo (PaginationInfo value)`
-

Detailed Description

Cases Schema

This schema contains [Cases](#) type details.

XML Schema File

model/v15/xsd/interaction/case.xsd

Name	Description	Type
link	Can be self link or link to 'case'	Link
case	Case details	Case
count	Count of the number of cases	Long
paginationInfo	Pagination details of cases	PaginationInfo

Member Function Documentation

`java.util.List<Case> getCase ()`

Gets the value of the case property.

This accessor method returns a reference to the live list, not a snapshot. Therefore any modification you make to the returned list will be present inside the JAXB object. This is why there is not a `set` method for the case property.

For example, to add a new item, do as follows:

```
getCase() .add(newItem);
```

Objects of the following type(s) are allowed in the list [Case](#)

`long getCount ()`

Gets the value of the count property.

Returns:

possible object is [Long](#)

[Link](#) getLink ()

Gets the value of the link property.

Returns:

possible object is [Link](#)

[PaginationInfo](#) getPaginationInfo ()

Gets the value of the paginationInfo property.

Returns:

possible object is [PaginationInfo](#)

void setCount (long *value*)

Sets the value of the count property.

Parameters:

<i>value</i>	allowed object is Long
--------------	--

void setLink ([Link](#) *value*)

Sets the value of the link property.

Parameters:

<i>value</i>	allowed object is Link
--------------	--

void setPaginationInfo ([PaginationInfo](#) *value*)

Sets the value of the paginationInfo property.

Parameters:

<i>value</i>	allowed object is PaginationInfo
--------------	--

CaseSearchExamples Class Reference

Detailed Description

Examples for Case Search

Example 1 - Search for cases by customer with summary attributes in response

This example demonstrates the following:

- Search for cases based on customer ID. sorting and default page number. Note that the results would be the same even if the default sorting was explicitly specified. In that case, the URL would be `/ws/v12/interaction/case?customer=1014&$sort=id&$order=asc`.
- Representation of the summary attributes, since \$attribute is not supplied.

XML

Request

Method	URL
GET	<code>/ws/v12/interaction/case?customer=1014</code>

Example 3 - Search for cases by multiple attributes with pagination parameters

This example demonstrates the following:

- Search cases based on status, customer's email address and phone number.
- Specifying the pagination parameters (pagenum and pagesize). The response also shows the links to the previous and next page.
- Specifying an additional custom attribute to be sent in the response, along with the summary attributes.
- Sorting on custom attribute.

XML

Request

Method	URL
GET	ws/v12/interaction/case?\$attribute=custom.work_status&status=closed&phone=1001001000&email=johnt@customer.com&\$pagenum=2&\$pagesize=2&\$sort=custom.work_status

Request headers

```

CaseSearchPage Class Reference

Detailed Description

Case Search

Overview

This API allows users to search for cases based on various criteria. If no cases match the search criteria, the server will respond with 204 success code and an empty body.

This API only supports exact match searches; partial matches are not supported. For example, if a client searches for cases associated with email address paul@example.com, only those cases where customer's contact point value is paul@example.com will be returned. The case with customer's contact point value of dean.paul@example.com will not be returned.

Since:

11.6

APIs

Method	URL	Description
GET	<code>/ws/v12/interaction/case?customer={ID}</code>	Retrieve cases for one customer ID. {ID} is the ID of the customer.
GET	<code>/ws/v12/interaction/case?email={EMAIL_ADDRESS}</code>	Retrieve cases of a customer with a specified email address. {EMAIL_ADDRESS} is the email address of the customer.
GET	<code>/ws/v12/interaction/case?phone={PHONE_NUMBER}</code>	Retrieve cases of a customer with a specified phone number. {PHONE_NUMBER} is the phone number of the customer.
GET	<code>/ws/v12/interaction/case?custom.<name>={VAL}</code>	Retrieve cases having custom attribute <name> with value {VAL}

NOTE: You can mix and match one or more filter criteria listed above in any order. If more than one filter criteria are used, then response will only contain cases that satisfy all filter criteria.

Authentication

Authentication is required. The client must be logged in to call this API. Each API request must

contain X-egain-session request header returned by Login API.

Permissions

All of the following are required:

- 'View Agent Console' action
- Only cases that satisfy one of the below conditions will be returned by server:
 - case belongs to user's home department;
 - case belongs to a department where the user is a foreign user;
 - the department of the case is shared with the department of the user, and as part of this sharing, activity sharing is enabled as well.

Licenses

The logged in user must have the following licenses:

- ECE CIH Platform

Request

Request headers

Name	Description	Allowed values	Default value
X-egain-session	Session ID obtained from Login API response header	N/A	N/A
Accept	Content type accepted by client	application/xml or application/json	N/A
Accept-Language	Language locale accepted by client (used for locale specific fields in resource representation and in error responses)	Supported 'Accept-Language' header codes	default system language

Supported API specific query parameters

One or more query parameters listed below can be supplied per API call:

- **customer:** customer ID to be used in case search.
- **email:** email address of a contact person of the customer to be used in case search.
- **phone:** phone number of a contact person of the customer to be used in case search. The phone number must be unformatted (no spaces, hyphens, etc).
- **status:** status of the case. Status value must be either "open" or "closed". Searching for "open" cases will return all cases which are not closed.
- **custom .<name>:** custom attribute value for custom attribute <name> of a case to be used in case search.

Supported common query parameters

Refer to [Supported Common Query Parameters in ECE REST API](#) page for detailed description of each common parameter listed below.

- \$attribute - [Values of \\$attribute common parameter supported by Case Resource](#)
- \$sort - [Values of \\$sort common parameter supported by Case Resource](#)
- \$order
- \$pagenum
- \$pagesize
- \$rangestart
- \$rangesize

Response

Response headers

Name	Description	Possible values
X-egain-session	Session ID of the current user session	N/A
Content-Type	Media type of response body	application/xml or application/json

Response body xml schemas:

- [Cases Schema](#) - used in case of success
- [Error](#) - used in case of error

Summary attributes always returned in server response

[Summary attributes of Case Resource](#)

Additional attributes returned in server response if explicitly requested by client

Server can be prompted to return additional attributes of resource representation using \$attribute common query parameter. [Values of \\$attribute common parameter supported by Case Resource](#) for the list of allowed attribute names.

HTTP status codes

Success Status codes

200 - OK

- Matches are found for this search and returned in the response body.

204 - No Content

- No matches were found for given search criteria.
- Matches found for this search, however the requested page or range doesn't contain any results.

Failure Status codes

400 - Bad Request

- Unsupported query parameter is sent in the request.

- Unsupported value for query parameter is sent in the request.
- None of the API specific query parameter is provided (since at least one search criterion is required).
- Unsupported combination of common query parameters (\$order provided without \$sort, mixing of pagination and range parameters etc.).

401 - Unauthorized

- X-egain-session request header is missing.
- Session is invalid or expired.

403 - Forbidden

- The user does not have sufficient permissions. Refer the "Permissions" section for details.

406 - Not Acceptable

- Invalid 'Accept-Language' header value.

500 - Internal server error

Examples:

[Example 1 - Search for cases by customer with summary attributes in response](#)

[Example 2 - Search for cases by status and custom attribute, with range parameters](#)

[Example 3 - Search for cases by multiple attributes with pagination parameters](#)

Name	Description	Type
id	ID of the category.	Long
name	An element that holds name of the category.	String
isComplaint	A flag that indicates if category is a complaint or not.	Boolean

Member Function Documentation

long getId ()

Gets the value of the id property.

Returns:

possible object is [Long](#)

java.lang.String getName ()

Gets the value of the name property.

Returns:

possible object is [java.lang.String](#)

Boolean isIsComplaint ()

Gets the value of the isComplaint property.

Returns:

possible object is [Boolean](#)

void setId (long *value*)

Sets the value of the id property.

Parameters:

<i>value</i>	allowed object is Long
--------------	--

void setIsComplaint (Boolean *value*)

Sets the value of the isComplaint property.

Parameters:

<i>value</i>	allowed object is Boolean
--------------	---

void setName (java.lang.String *value*)

Sets the value of the name property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

--------------	--

ChangeCustomerForCaseExamples Class Reference

Detailed Description

Examples for change customer of a case

Example 1 - Change customer of a case

This example demonstrates the following:

- Changing the customer of a case.

XML

Request

Method	URL
PUT	ws/v12/interaction/case/1001/changecustomer

Request headers

Name	Value
X-egain-session	Valid session ID
Accept	application/xml
Content-Type	application/xml
Accept-Language	en-US

Request body

```
<?xml version="1.0" encoding="UTF-8" standalone="yes"?><case xmlns="http://bindings.egain.com/ws/model/v12/gen/interaction/case" id="1003"/></case>
```

Response

HTTP/1.1 204 No Content

Response headers

Name	Value
X-egain-session	current session ID
Content-Type	application/xml

JSON

Request

Method	URL
PUT	ws/v12/interaction/case/1001

	/changecustomer
--	-----------------

Request headers

Name	Value
X-egain-session	Valid session ID
Accept	application/json
Content-Type	application/json
Accept-Language	en-US

Request body

```
{ "customer": { "id": 1003 } }
```

Response

HTTP/1.1 204 No Content

Response headers

Name	Value
X-egain-session	current session ID
Content-Type	application/json

ChangeCustomerForCasePage Class Reference

Detailed Description

Change Customer for Case

Overview

This API can be used to change the customer of a single case.

For this API to execute successfully:

- The Case ID must exist in the application.
- The status of the case must be 'open'.
- Source and target customer of the case must be different.
- If "Customer departmentalization" setting is enabled in the application, source and target customer of the case must belong to the same department.

Since:

11.6

APIs

Method	URL	Description
PUT	/ws/v12/interaction/case/{ID}/changecustomer	Change customer of a case with specified {ID} to the target customer specified in the request body.

Authentication

Authentication is required. The client must be logged in to call this API. Each API request must contain X-egain-session request header returned by Login API.

Permissions

- User must have "Change Customer" action on "Customer" resource.
- The case must either belong to the user's home department, or to a department in which the user is a foreign user.

Licenses

The logged in user must have the following licenses:

- ECE CIH Platform

Request

Request headers

Name	Description	Allowed values	Default value
X-again-session	Session ID obtained from Login API response header	N/A	N/A
Accept	Content type accepted by client.	application/xml or application/json	N/A
Content-Type	Media type sent by the client	application/xml or application/json	N/A
Accept-Language	Language locale accepted by client (used for locale specific fields in resource representation and in error responses)	Supported 'Accept-Language' header codes	default system language

Request Body

The request body is mandatory and can be in either XML or JSON format.

Elements required in the request body

Name	Description
case.customer.id	ID of the target customer

Optional elements allowed in the request body

None

Request body XML schemas:

- [Case Schema](#)

Supported API specific query parameters

None

Supported common query parameters

None

Response

Response headers

Name	Description	Possible values
X-egain-session	ID of the current user session	N/A
Content-Type	Media type of response body	application/xml or application/json

Response body

The response body will be sent only in case of error. It can be in either XML or JSON format.

Response body XML schemas:

- [Error](#) - used in case of error

HTTP status codes

Success Status codes

204 - No Content

- Successfully changed the customer of the case.

Failure Status codes

400 - Bad Request

- Any query parameter is sent in the request.
- Any criteria for successful execution mentioned in [Overview](#) or [Request Body](#) sections are violated.

401 - Unauthorized

- X-egain-session request header is missing.
- Session is invalid or expired.

403 - Forbidden

- The user does not have appropriate permissions for this operation. Refer the [Permissions](#) section.

404 - Not Found

- Case ID provided in the URI does not exist.

406 - Not Acceptable

- Invalid 'Accept-Language' header value.

500 - Internal server error

Examples:

[Example 1 - Change customer of a case](#)

ChannelConfiguration Class Reference

</complexContent></complexType>
```

Member Function Documentation

java.lang.String [getAddToReply](#) ()

Gets the value of the addToReply property.

Returns:

possible object is [java.lang.String](#)

java.lang.String getAgentPortalURL ()

Gets the value of the agentPortalURL property.

Returns:

possible object is [java.lang.String](#)

java.lang.String getAnalyticsParameters ()

Gets the value of the analyticsParameters property.

Returns:

possible object is [java.lang.String](#)

java.lang.String getCustomerPortalURL ()

Gets the value of the customerPortalURL property.

Returns:

possible object is [java.lang.String](#)

Long getPortalId ()

Gets the value of the portalId property.

Returns:

possible object is [Long](#)

java.lang.String getSearchParameters ()

Gets the value of the searchParameters property.

Returns:

possible object is [java.lang.String](#)

java.lang.String getStartPage ()

Gets the value of the startPage property.

Returns:

possible object is [java.lang.String](#)

void setAddToReply (java.lang.String value)

Sets the value of the addToReply property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setAgentPortalURL (java.lang.String value)

Sets the value of the agentPortalURL property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setAnalyticsParameters (java.lang.String value)

Sets the value of the analyticsParameters property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setCustomerPortalURL (java.lang.String value)

Sets the value of the customerPortalURL property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setPortalId (Long value)

Sets the value of the portalId property.

Parameters:

<i>value</i>	allowed object is Long
--------------	--

void setSearchParameters (java.lang.String value)

Sets the value of the searchParameters property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setStartPage (java.lang.String value)

Sets the value of the startPage property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

Detailed Description

ChatAttributes Schema

This schema contains the definition of all chat specific attributes of a chat activity.

XML Schema File

model/v12/xsd/interaction/activity.xsd

Name	Description	Type
isConference	Details about whether this activity was conferenced.	String
entryPoint	Details of the entry point for a chat link that is displayed on a website	EntryPoint
closedBy	Information about the user who closed this activity.	User
clientInfo	Information about the customer machine used in chat.	ClientInfo
custDisplayName	Display name of the customer, as provided during chat initiation	String
origDepartment	Information about the original department of the Chat.	Department
transcript	This has the Chat transcript. This can have multiple 'Content' elements.	Contents

Member Function Documentation

[ClientInfo](#) getClientInfo ()

Gets the value of the clientInfo property.

Returns:

possible object is [ClientInfo](#)

[User](#) getClosedBy ()

Gets the value of the closedBy property.

Returns:

possible object is [User](#)

java.lang.String getCustDisplayName ()

Gets the value of the custDisplayName property.

Returns:

possible object is [java.lang.String](#)

[EntryPoint](#) getEntryPoint ()

Gets the value of the entryPoint property.

Returns:

possible object is [EntryPoint](#)

[ChatConference](#) getIsConference ()

Gets the value of the isConference property.

Returns:

possible object is [ChatConference](#)

[Department](#) getOrigDepartment ()

Gets the value of the origDepartment property.

Returns:

possible object is [Department](#)

[Contents](#) getTranscript ()

Gets the value of the transcript property.

Returns:

possible object is [Contents](#)

void setClientInfo ([ClientInfo](#) value)

Sets the value of the clientInfo property.

Parameters:

<i>value</i>	allowed object is ClientInfo
--------------	--

void setClosedBy ([User](#) value)

Sets the value of the closedBy property.

Parameters:

<i>value</i>	allowed object is User
--------------	--

void setCustDisplayName ([java.lang.String](#) value)

Sets the value of the custDisplayName property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setEntryPoint ([EntryPoint](#) value)

Sets the value of the entryPoint property.

Parameters:

<i>value</i>	allowed object is EntryPoint
--------------	--

void setIsConference ([ChatConference](#) value)

Sets the value of the isConference property.

Parameters:

<i>value</i>	allowed object is ChatConference
--------------	--

void setOrigDepartment ([Department](#) value)

Sets the value of the origDepartment property.

Parameters:

<i>value</i>	allowed object is Department
--------------	--

void setTranscript ([Contents](#) value)

Sets the value of the transcript property.

Parameters:

<i>value</i>	allowed object is Contents
--------------	--

Detailed Description

ChatAttributes Schema

This schema contains the definition of all chat specific attributes of a chat activity.

XML Schema File

model/v15/xsd/interaction/activity.xsd

Name	Description	Type
isConference	Details about whether this activity was conferenced.	String
entryPoint	Details of the entry point for a chat link that is displayed on a website	EntryPoint
closedBy	Information about the user who closed this activity.	User
clientInfo	Information about the customer machine used in chat.	ClientInfo
custDisplayName	Display name of the customer, as provided during chat initiation	String
origDepartment	Information about the original department of the Chat.	Department
transcript	This has the Chat transcript. This can have multiple 'Content' elements.	Contents

Member Function Documentation

[ClientInfo](#) getClientInfo ()

Gets the value of the clientInfo property.

Returns:

possible object is [ClientInfo](#)

[User](#) getClosedBy ()

Gets the value of the closedBy property.

Returns:

possible object is [User](#)

java.lang.String getCustDisplayName ()

Gets the value of the custDisplayName property.

Returns:

possible object is [java.lang.String](#)

[EntryPoint](#) getEntryPoint ()

Gets the value of the entryPoint property.

Returns:

possible object is [EntryPoint](#)

[ChatConference](#) getIsConference ()

Gets the value of the isConference property.

Returns:

possible object is [ChatConference](#)

[Department](#) getOrigDepartment ()

Gets the value of the origDepartment property.

Returns:

possible object is [Department](#)

[Contents](#) getTranscript ()

Gets the value of the transcript property.

Returns:

possible object is [Contents](#)

void setClientInfo ([ClientInfo](#) value)

Sets the value of the clientInfo property.

Parameters:

<i>value</i>	allowed object is ClientInfo
--------------	--

void setClosedBy ([User](#) value)

Sets the value of the closedBy property.

Parameters:

<i>value</i>	allowed object is User
--------------	--

void setCustDisplayName ([java.lang.String](#) value)

Sets the value of the custDisplayName property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setEntryPoint ([EntryPoint](#) value)

Sets the value of the entryPoint property.

Parameters:

<i>value</i>	allowed object is EntryPoint
--------------	--

void setIsConference ([ChatConference](#) value)

Sets the value of the isConference property.

Parameters:

<i>value</i>	allowed object is ChatConference
--------------	--

void setOrigDepartment ([Department](#) value)

Sets the value of the origDepartment property.

Parameters:

<i>value</i>	allowed object is Department
--------------	--

void setTranscript ([Contents](#) value)

Sets the value of the transcript property.

Parameters:

<i>value</i>	allowed object is Contents
--------------	--

Detailed Description

ChatConference Schema

This schema has the definition of [ChatConference](#) type.

XML Schema File

model/v12/xsd/interaction/activity.xsd

Name	Description	Type
value	Details about whether this activity was conferenced.	Boolean
users	Details of the users who were part of the conference, if the value is true.	Users

Member Function Documentation

[Users](#) [getUsers](#) ()

Gets the value of the users property.

Returns:

possible object is [Users](#)

Boolean [isValue](#) ()

Gets the value of the value property.

Returns:

possible object is [Boolean](#)

void [setUsers](#) ([Users](#) value)

Sets the value of the users property.

Parameters:

<i>value</i>	allowed object is Users
--------------	---

void setValue (Boolean *value*)

Sets the value of the value property.

Parameters:

<i>value</i>	allowed object is Boolean
--------------	---

<enumeration value="resolution_code"/> </restriction> </simpleType>
</element> </sequence> </restriction> </complexContent></complexType>
```

Member Function Documentation

long getClassificationId ()

Gets the value of the classificationId property.

java.lang.String getClassificationName ()

Gets the value of the classificationName property.

Returns:

possible object is [java.lang.String](#)

java.lang.String getClassificationType ()

Gets the value of the classificationType property.

Returns:

possible object is [java.lang.String](#)

void setClassificationId (long value)

Sets the value of the classificationId property.

void setClassificationName (java.lang.String value)

Sets the value of the classificationName property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setClassificationType (java.lang.String value)

Sets the value of the classificationType property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

Classifications Class Reference

Public Member Functions

- `java.util.List<Category> getCategory ()`
 - `java.util.List<ResolutionCode> getResolutionCode ()`
-

Detailed Description

Classifications Schema

This schema has the definition of [Classifications](#).

XML Schema File

model/v15/xsd/interaction/activity.xsd

Name	Description	Type
category	This will have the attributes for category of an activity.	Category
resolutionCode	This will have the attributes for resolution code of an activity.	ResolutionCode

Member Function Documentation

`java.util.List<Category> getCategory ()`

Gets the value of the category property.

This accessor method returns a reference to the live list, not a snapshot. Therefore any modification you make to the returned list will be present inside the JAXB object. This is why there is not a `set` method for the category property.

For example, to add a new item, do as follows:

```
getCategory().add(newItem);
```

Objects of the following type(s) are allowed in the list [Category](#)

`java.util.List<ResolutionCode> getResolutionCode ()`

Gets the value of the resolutionCode property.

This accessor method returns a reference to the live list, not a snapshot. Therefore any modification you make to the returned list will be present inside the JAXB object. This is why there is not a `set` method for the resolutionCode property.

For example, to add a new item, do as follows:

```
getResolutionCode().add(newItem);
```

Objects of the following type(s) are allowed in the list [ResolutionCode](#)

ClientInfo Schema

This schema has the definition of [ClientInfo](#) type.

XML Schema File

model/v12/xsd/interaction/activity.xsd

Name	Description	Type
clientIp	This has the IP address of the customer machine.	String
userAgent	This has the browser information about the client machine.	String
referrerUrl	This has the URL of the referrer.	String
referrerName	This is the name of the referrer.	String

Member Function Documentation

java.lang.String getClientIp ()

Gets the value of the clientIp property.

Returns:

possible object is [java.lang.String](#)

java.lang.String getReferrerName ()

Gets the value of the referrerName property.

Returns:

possible object is [java.lang.String](#)

java.lang.String getReferrerUrl ()

Gets the value of the referrerUrl property.

Returns:

possible object is [java.lang.String](#)

java.lang.String getUserAgent ()

Gets the value of the userAgent property.

Returns:

possible object is [java.lang.String](#)

void setClientIp (java.lang.String value)

Sets the value of the clientIp property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setReferrerName (java.lang.String value)

Sets the value of the referrerName property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setReferrerUrl (java.lang.String value)

Sets the value of the referrerUrl property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setUserAgent (java.lang.String value)

Sets the value of the userAgent property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

Gets the value of the clientIp property.

Returns:

possible object is [java.lang.String](#)

java.lang.String getReferrerName ()

Gets the value of the referrerName property.

Returns:

possible object is [java.lang.String](#)

java.lang.String getReferrerUrl ()

Gets the value of the referrerUrl property.

Returns:

possible object is [java.lang.String](#)

java.lang.String getUserAgent ()

Gets the value of the userAgent property.

Returns:

possible object is [java.lang.String](#)

void setClientIp (java.lang.String value)

Sets the value of the clientIp property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setReferrerName (java.lang.String value)

Sets the value of the referrerName property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setReferrerUrl (java.lang.String value)

Sets the value of the referrerUrl property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setUserAgent (java.lang.String value)

Sets the value of the userAgent property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

CloseCaseExamples Class Reference

Detailed Description

Examples for close case

Example 1 - Close a case

This example demonstrates the following:

- Closing a case.

XML

Request

Method	URL
PUT	/ws/v12/interaction/case/1000/close

Request headers

Name	Value
X-egain-session	Valid session ID
Accept-Language	en-US
Accept	application/xml

Request body

Request body is not allowed.

Response

HTTP/1.1 204 No Content

Response headers

Name	Value
X-egain-session	current session ID
Content-Type	application/xml

JSON

Request

Method	URL
PUT	/ws/v12/interaction/case/1000/close

Request headers

Name	Value
X-egain-session	Valid session ID

Accept-Language	en-US
Accept	application/json

Request body

Request body is not allowed.

Response

HTTP/1.1 204 No Content

Response headers

Name	Value
X-egain-session	current session ID
Content-Type	application/json

CloseCasePage Class Reference

Detailed Description

Close Case

Overview

This API can be used to close a single case.

For this API to execute successfully:

- The Case ID must exist in the application.
- The status of the case must be 'open'.
- Any open activities for the case must be of type Email. The case cannot be closed if it has any open Chat activities
- If there are any open activities in the case, such activities
 - Must be either "in queue waiting to be assigned" or "assigned to a user" status.
 - Must not be awaiting supervision i.e., waiting for supervisor to accept or reject the activity.
-
- If an activity of the case is assigned to a different user, it must not be locked by the user.
-

As part of completing this API request:

- All open activities of the case will be completed before closing the case.
- The case will not be closed if there are any open Chat activities in the case.

Since:

11.6

APIs

Method	URL	Description
PUT	/ws/v12/interaction/case/{id}/close	Close a case.

Authentication

Authentication is required. The client must be logged in to call this API. Each API request must contain X-again-session request header returned by Login API.

Permissions

- User must have 'Close Case' action.
- Case must either belong to the user's home department, or to a department in which the user is a foreign user.

- All the open activities of the case must either belong to the home department of the logged in user, or to a department in which the user is a foreign user.
- If activity is not assigned to the logged in user, the logged in user must have the permission to pick activities as required by Pick Activities API. Refer [Pick activities permissions](#) section for details.

Licenses

The logged in user must have the following licenses:

- ECE CIH Platform
- If activity is not assigned to the logged in user, the logged in user must have the licenses as required by Pick Activities API. Refer [Licenses](#) section for details.

Request

Request headers

Name	Description	Allowed values	Default value
X-egain-session	Session ID obtained from Login API response header	N/A	N/A
Accept-Language	Language locale accepted by client (used for locale specific fields in resource representation and in error responses)	Supported 'Accept-Language' header codes	default system language
Accept	Content type accepted by client. Used for error response.	application/xml or application/json	application/json

Request Body

Request body is not allowed.

Supported API specific query parameters

None

Supported common query parameters

None

Response

Response headers

Name	Description	Possible values
X-egain-session	ID of the current user session	N/A
Content-Type	Media type of response body	application/xml or application/json

Response body

The response body will be sent only in case of error. It can be in either XML or JSON format.

Response body XML schemas:

- [Error](#) - used in case of error

HTTP status codes

Success Status codes

204 - No Content

- Successfully closed the case.

Failure Status codes

400 - Bad Request

- Any query parameter is sent in the request.
- Request body is sent.
- Any criteria for successful execution mentioned in the [Overview](#) section is violated (except when activity is locked, which will result in 403-Forbidden).

401 - Unauthorized

- X-egain-session request header is missing.
- Session is invalid or expired.

403 - Forbidden

- If the user does not have the appropriate permissions for this operation. Refer the [Permissions](#) section.
- One or more activities of the case are locked by another user.

404 - Not Found

- If the case with the specified ID does not exist.

406 - Not Acceptable

- Invalid 'Accept-Language' header value.

500 - Internal server error

Examples:

[Example 1 - Close a case](#)

CommonParametersPage Class Reference

Detailed Description

Supported Common Query Parameters in ECE REST API

In addition to API specific query parameters, ECE REST API define query parameters that are applicable to sets of APIs and are not closely related to the function of any API. Such parameters are referred to as "*common query parameters*" or simply "*common parameters*" in this documentation. Common parameters always start with '\$' (dollar sign) symbol.

This page describes all the *common query parameters* that may appear in ECE REST APIs. While this is a comprehensive list of common parameters that are currently in use, each API may choose from below list which parameters to support.

All *common query parameters* are **optional** query parameters unless stated otherwise in a specific API documentation.

Name	Description	Default value	Allowed Values
\$pagenum	<i>Pagination</i> parameter that specifies the page number of results to be returned. Used in conjunction with \$pagesize.	1	A positive integer
\$pagesize	<i>Pagination</i> parameter that specifies the number of results per page. Used in conjunction with \$pagenum.	25	An integer between 1 and 75
\$rangestart	<i>Range</i> parameter that specifies the starting index of the range of results to be returned. Used in conjunction with \$rangesize.	1	A positive integer
\$rangesize	<i>Range</i> parameter that specifies the number (range) of results to be returned. Used in conjunction with \$rangestart.	25	An integer between 1 and 75
\$sort	Indicates the resource attribute name on	N/A	Each API that supports sorting, has

	which the results must be sorted. Only a single attribute name is allowed; comma separated values are not supported.		its own set of allowed values
\$order	Indicates the sorting order. Must be accompanied by \$sort.	'asc'	'asc' and 'desc'
\$lang	Mostly used in Authoring APIs to specify the language of requested Authoring resource, like article, folder, topic etc.	Default user language	supported-dollar-lang-values
\$level	If the requested resource represents a hierarchical structure (e.g., folders), \$level may be used to indicate the depth of hierarchy (starting from root node) up to which the results should be returned.	0	<ul style="list-style-type: none"> • 0 (only root node is returned) • a positive integer (the actual level of depth) • -1 (entire hierarchy is expanded)
\$count	If this parameter is provided, only the total number of items qualifying the request will be returned, along with the link to the first page of the items. The actual items will not be returned.	'N/A'	'yes'
\$attribute	A comma separated list of attribute names to be returned in resource representation in addition to summary attributes.	N/A	<ul style="list-style-type: none"> • all (all available attributes are returned) • Additionally, each API that supports \$attribute, has its own set of allowed values

NOTE : *Pagination* and *Range* parameters cannot be used together in the same request and

will result in **400 - Bad Request** server response.

CompleteActivityExamples Class Reference

Detailed Description

Examples for completing activities

Example 1 - Complete activities of multiple cases

This example demonstrates the following:

- Completing multiple activities. In this example, two activities are completed.
- Response representation when the case of one of the activities remains open, and the other activities' case is closed.

XML

Request

Method	URL
PUT	/ws/v12/interaction/activity/complete

Request headers

Name	Value
X-egain-session	Valid session ID
Accept	application/xml
Content-Type	application/xml
Accept-Language	en-US

Request body:

```
<?xml version="1.0" encoding="UTF-8"?><activities
xmlns="http://bindings.egain.com/ws/model/v12/gen/interaction/activity">  <activity id="1025">
<lastModified date="2015-07-14T23:51:58.000Z" />  </activity>  <activity id="1039">
<lastModified date="2015-07-14T23:51:58.000Z" />  </activity></activities>
```

Response:

HTTP/1.1 200 OK

Response headers

Name	Value

ComposeAndSaveEmailExamples Class Reference

Detailed Description

Examples for compose and save email activity

Example 1 - Compose email for an existing case with required elements, using XML/JSON as content-type

Using XML/JSON as the content-type, this example demonstrates the following:

- Composing an email for an existing case
- Composing an email using required elements, subject and content.

XML

Request

Method	URL
POST	/ws/v12/interaction/activity

Request headers

Name	Value
X-egain-session	Valid session ID
Accept	application/xml
Content-Type	application/xml
Accept-Language	en-US

Request body:

```
<?xml version="1.0" encoding="UTF-8"?> <activity
xmlns="http://bindings.egain.com/ws/model/v12/gen/interaction/activity"
xmlns:ns2="http://bindings.egain.com/ws/model/v12/gen/platform"
xmlns:ns3="http://bindings.egain.com/ws/model/v12/gen/common" >
<ns2:name>service</ns2:name> </department> <type> <value>email</value>
<subtype> <ns3:value>compose</ns3:value> </subtype> </type> <case
id='1061'/> <subject>Issue with mobile phone</subject> <payload> <email>
<contents> <content> <ns3:type>text</ns3:type> <content>

ComposeAndsendcompleteEmailExamples Class Reference

Detailed Description

Examples for compose and send-complete email activity

Example 1 - Compose email with macros for an existing case with required elements, using XML/JSON as content-type

Using XML/JSON as the content-type, this example demonstrates the following:

- Composing an email for an existing case
- Composing an email using required elements, subject and content
- Using macros in subject and content of the email

XML

Request

Method	URL
POST	/ws/v12/interaction/activity/sendcomplete

Request headers

Name	Value
X-egain-session	Valid session ID
Accept	application/xml
Content-Type	application/xml
Accept-Language	en-US

Request body:

```
<?xml version="1.0" encoding="UTF-8"?> <activity
xmlns="http://bindings.egain.com/ws/model/v12/gen/interaction/activity"
xmlns:ns2="http://bindings.egain.com/ws/model/v12/gen/platform"
xmlns:ns3="http://bindings.egain.com/ws/model/v12/gen/common" >
  <department>
    <ns2:name>service</ns2:name> </department> <type>
      <value>email</value>
    <subtype>
      <ns3:value>compose</ns3:value> </subtype> </type> <case
id='1061'/'>
      <subject>Issue with mobile phone. Ref: ``external_case_id</subject>

  </payload>
</activity>
```

Response:

HTTP/1.1 201 Created

Response headers

Name	Value
X-egain-session	current session ID
Content-Type	application/xml
Location	/system/ws/v12/interaction/activity/2795

JSON

Request

Method	URL
POST	/ws/v12/interaction/activity/sendcomplete

Request headers :

Name	Value
X-egain-session	Valid session ID
Content-Type	application/json
Accept	application/json
Accept-Language	en-US

Request body:

```
{ "department": { "name": "service" }, "type": { "value": "email", "subtype": { "value": "compose" } }, "case": { "id": "1061" }, "subject": "Issue with mobile phone. Ref: `external_case_id", "payload": { "email": { "contents": { "content": [ { "type": "text", "value": "The issue in your mobile is due to obsolete display driver. Please update the driver by following these steps: `update_display_driver" }, { "type": "html", "value": "<HTML><HEAD><TITLE></TITLE></HEAD><BODY><P>The issue in your mobile is due to obsolete display driver. Please update the driver by following these steps: `update_display_driver <BR></P></BODY></HTML>" } ], "emailAddresses": { "from": "support@business.com", "to": { "address": [ "jhenry@customer.com" ] } } } }
```

Response:

HTTP/1.1 201 Created

Response headers

Name	Value
X-egain-session	current session ID
Content-Type	application/json
Location	/system/ws/v12/interaction/activity/2795

Example 2 - Compose email with macros for a new case with required elements, using Multipart/form-data as content-type

Using Multipart/form-data as content-type, this example demonstrates the following:

- Composing an email for a new case
- Composing an email with required elements, subject and content
- Using macros in subject and content of the email

XML

Request

Method	URL
POST	/ws/v12/interaction/activity/sendcomplete

Request headers :

Name	Value
X-egain-session	Valid session ID
Content-Type	mutlipart/form-data; boundary=----WebKitFormBoundaryLyRAYGiE5mFu3Ucv
Accept	application/xml

ComposeAndsendEmailExamples Class Reference

Detailed Description

Examples for compose and send email activity

Example 1 - Compose email with macros for an existing case with required elements, using XML/JSON as content-type

Using XML/JSON as the content-type, this example demonstrates the following:

- Composing an email for an existing case
- Composing an email using required elements, subject and content.
- Using macros in subject and content of the email.

Example 4 - Compose an email for a new case with required elements, using Multipart/form-data as content-type

Using Multipart/form-data, this example demonstrates the following:

- Composing an email for a new case
- Composing an email with required elements, subject and content
- Using non-inline attachments

CompositeRequest Class Reference

Public Member Functions

- `java.util.List<Request> getRequest ()`
-

Detailed Description

CompositeRequest Schema

A [CompositeRequest](#) encapsulates multiple API calls in one client request.

XML Schema File

`model/v3/xsd/meta/compositeRequest.xsd`

Name	Description	Type	Included?
<code>request</code>	A list of zero or more Request instances.	Request	Always

Member Function Documentation

`java.util.List<Request> getRequest ()`

Gets the value of the request property.

This accessor method returns a reference to the live list, not a snapshot. Therefore any modification you make to the returned list will be present inside the JAXB object. This is why there is not a `set` method for the request property.

For example, to add a new item, do as follows:

```
getRequest ().add(newItem);
```

Objects of the following type(s) are allowed in the list [Request](#)

CompositeResult Class Reference

Public Member Functions

- `java.util.List<Result> getResult ()`
- `java.util.List<ResultV12> getResultObject ()`

Detailed Description

CompositeResult Schema

A [CompositeResult](#) encapsulates a response from the `meta/composite` API. It extends the [WSResult Schema](#).

The `meta/composite` API allows the caller to run several API calls on the server with one client call. The [CompositeResult](#) object contains a [Result](#) object for each of the embedded API calls.

XML Schema File

`model/v3/xsd/meta/compositeResult.xsd`

Name	Description	Type	Included?
result	A list of zero or more Result instances.	Result	Always

Member Function Documentation

`java.util.List<Result> getResult ()`

Gets the value of the result property.

This accessor method returns a reference to the live list, not a snapshot. Therefore any modification you make to the returned list will be present inside the JAXB object. This is why there is not a `set` method for the result property.

For example, to add a new item, do as follows:

```
getResult().add(newItem);
```

Objects of the following type(s) are allowed in the list [Result](#)

`java.util.List<ResultV12> getResultObject ()`

Gets the value of the resultObject property.

This accessor method returns a reference to the live list, not a snapshot. Therefore any modification you make to the returned list will be present inside the JAXB object. This is why there is not a `set` method for the resultObject property.

For example, to add a new item, do as follows:

```
getResultObject().add(newItem);
```

Objects of the following type(s) are allowed in the list [ResultV12](#)

Detailed Description

ContactPerson Schema

This schema contains [ContactPerson](#) type details.

XML Schema File

model/v12/xsd/interaction/contact_person.xsd

Name	Description	Type
------	-------------	------

id	ID of the requested contact person	Long
isSystemCreated	Field to convey if the contact person is system created	Boolean
salutation	Salutation of the contact person	String
firstName	First name of the contact person	String
middleName	Middle name of the contact person	String
lastName	Last name of the contact person	String
loginId	Login ID of the contact person	String
lastModified	Last modification details of the contact person	DateAndUser
jobTitle	Job Title of the contact person	String
employmentStatus	Employment status of the contact person	L1ONString
dateOfBirth	Date of birth of the contact person	DateTime
gender	Gender of the contact person	L1ONString
maritalStatus	Marital status of the contact person	L1ONString
identification	Identification details of the contact person	Identification
type	Contact person's type (e.g. billing, legal, shipping etc.)	L1ONString
firstNameFurigana	String to specify how the first name of the contact person should be pronounced	String
middleNameFurigana	String to specify how the middle name of the contact person should be pronounced	String
lastNameFurigana	String to specify how the last name of the contact person should be pronounced	String
suffix	Suffix to use for the contact person	L1ONString
initials	Initials of the contact person	String
startGreeting	String to specify start greeting to use for the contact person	String
endGreeting	String to specify end greeting to use for the contact person	String
spouseName	Name of spouse of the contact person	String
emergencyContact	Emergency Contact information of the contact person	String
priority	Priority of the contact person	String

secretQuestion	Secret question which should be asked to the contact person if he forgets his password	String
secretAnswer	Name and value of all the custom attributes configured for the Customer Object	String
occupation	Occupation of the contact person	String
incomeLevel	Income level of the contact person	String
educationLevel	Education level of the contact person	L10NString
race	Race of the contact person	String
dependents	Dependents of the contact person	String
isSmoker	Field to convey if the contact person is a smoker	Boolean
hobbies	Hobbies of the contact person	String
interests	Interests of the contact person	String
contactOrder	Number specifying the order in which this contact person should be contacted if there are more than one contact persons for the same customer	Int
hasDirectMailingConsent	Field to convey if direct mailing consent is given by the contact person	Boolean
hasDirectCallingConsent	Field to convey if direct calling consent is given by the contact person	Boolean
hasHoldingDataConsent	Field to convey if holding data consent is given by the contact person	Boolean
customAttributes	Name and value of all the custom attributes configured for the Contact Person Object	CustomAttributes
contactPoints	Details of all contact points associated with the contact person	ContactPoints
email	Details of all email contact points associated with the contact person (only for customer access)	Email
postal	Details of all postal contact points associated with the contact person (only for customer access)	Postal
phone	Details of all phone contact points associated with the contact person (only for	Phone

	customer access)	
website	Details of all website type contact points associated with the contact person (only for customer access)	Website
social	Details of all social type contact points associated with the contact person (only for customer access)	Social

Member Function Documentation

Integer getContactOrder ()

Gets the value of the contactOrder property.

Returns:

possible object is [Integer](#)

[ContactPoints](#) getContactPoints ()

Gets the value of the contactPoints property.

Returns:

possible object is [ContactPoints](#)

[CustomAttributes](#) getCustomAttributes ()

Gets the value of the customAttributes property.

Returns:

possible object is [CustomAttributes](#)

java.lang.String getDateOfBirth ()

Gets the value of the dateOfBirth property.

Returns:

possible object is [java.lang.String](#)

java.lang.String getDependents ()

Gets the value of the dependents property.

Returns:

possible object is [java.lang.String](#)

[L10NString](#) getEducationLevel ()

Gets the value of the educationLevel property.

Returns:

possible object is [L10NString](#)

java.util.List<[Email](#)> getEmail ()

Gets the value of the email property.

This accessor method returns a reference to the live list, not a snapshot. Therefore any modification you make to the returned list will be present inside the JAXB object. This is why there is not a `set` method for the email property.

For example, to add a new item, do as follows:

```
getEmail().add(newItem);
```

Objects of the following type(s) are allowed in the list [Email](#)

java.lang.String getEmergencyContact ()

Gets the value of the emergencyContact property.

Returns:

possible object is [java.lang.String](#)

[L10NString](#) getEmploymentStatus ()

Gets the value of the employmentStatus property.

Returns:

possible object is [L10NString](#)

java.lang.String getEndGreeting ()

Gets the value of the endGreeting property.

Returns:

possible object is [java.lang.String](#)

java.lang.String getFirstName ()

Gets the value of the firstName property.

Returns:

possible object is [java.lang.String](#)

java.lang.String getFirstNameFurigana ()

Gets the value of the firstNameFurigana property.

Returns:

possible object is [java.lang.String](#)

[L10NString](#) getGender ()

Gets the value of the gender property.

Returns:

possible object is [L10NString](#)

java.lang.String getHasDirectCallingConsent ()

Gets the value of the hasDirectCallingConsent property.

Returns:

possible object is [java.lang.String](#)

java.lang.String getHasDirectMailingConsent ()

Gets the value of the hasDirectMailingConsent property.

Returns:

possible object is [java.lang.String](#)

java.lang.String getHasHoldingDataConsent ()

Gets the value of the hasHoldingDataConsent property.

Returns:

possible object is [java.lang.String](#)

java.lang.String getHobbies ()

Gets the value of the hobbies property.

Returns:

possible object is [java.lang.String](#)

long getId ()

Gets the value of the id property.

Returns:

possible object is [Long](#)

[Identification](#) getIdentification ()

Gets the value of the identification property.

Returns:

possible object is [Identification](#)

java.lang.String getIncomeLevel ()

Gets the value of the incomeLevel property.

Returns:

possible object is [java.lang.String](#)

java.lang.String getInitials ()

Gets the value of the initials property.

Returns:

possible object is [java.lang.String](#)

java.lang.String getInterests ()

Gets the value of the interests property.

Returns:

possible object is [java.lang.String](#)

java.lang.String getIsSmoker ()

Gets the value of the isSmoker property.

Returns:

possible object is [java.lang.String](#)

java.lang.String getJobTitle ()

Gets the value of the jobTitle property.

Returns:

possible object is [java.lang.String](#)

[DateAndUser](#) getLastModified ()

Gets the value of the lastModified property.

Returns:

possible object is [DateAndUser](#)

java.lang.String getLastName ()

Gets the value of the lastName property.

Returns:

possible object is [java.lang.String](#)

java.lang.String getLastNameFurigana ()

Gets the value of the lastNameFurigana property.

Returns:

possible object is [java.lang.String](#)

java.lang.String getLoginId ()

Gets the value of the loginId property.

Returns:

possible object is [java.lang.String](#)

[L10NString](#) getMaritalStatus ()

Gets the value of the maritalStatus property.

Returns:

possible object is [L10NString](#)

java.lang.String getMiddleName ()

Gets the value of the middleName property.

Returns:

possible object is [java.lang.String](#)

java.lang.String getMiddleNameFurigana ()

Gets the value of the middleNameFurigana property.

Returns:

possible object is [java.lang.String](#)

java.lang.String getOccupation ()

Gets the value of the occupation property.

Returns:

possible object is [java.lang.String](#)

java.util.List<[Phone](#)> getPhone ()

Gets the value of the phone property.

This accessor method returns a reference to the live list, not a snapshot. Therefore any modification you make to the returned list will be present inside the JAXB object. This is why there is not a `set` method for the phone property.

For example, to add a new item, do as follows:

```
getPhone().add(newItem);
```

Objects of the following type(s) are allowed in the list [Phone](#)

java.util.List<[Postal](#)> getPostal ()

Gets the value of the postal property.

This accessor method returns a reference to the live list, not a snapshot. Therefore any modification you make to the returned list will be present inside the JAXB object. This is why there is not a `set` method for the postal property.

For example, to add a new item, do as follows:

```
getPostal().add(newItem);
```

Objects of the following type(s) are allowed in the list [Postal](#)

java.lang.String getPriority ()

Gets the value of the priority property.

Returns:

possible object is [java.lang.String](#)

java.lang.String getRace ()

Gets the value of the race property.

Returns:

possible object is [java.lang.String](#)

java.lang.String getSalutation ()

Gets the value of the salutation property.

Returns:

possible object is [java.lang.String](#)

java.lang.String getSecretAnswer ()

Gets the value of the secretAnswer property.

Returns:

possible object is [java.lang.String](#)

java.lang.String getSecretQuestion ()

Gets the value of the secretQuestion property.

Returns:

possible object is [java.lang.String](#)

java.util.List<[Social](#)> getSocial ()

Gets the value of the social property.

This accessor method returns a reference to the live list, not a snapshot. Therefore any modification you make to the returned list will be present inside the JAXB object. This is why there is not a `set` method for the social property.

For example, to add a new item, do as follows:

```
getSocial().add(newItem);
```

Objects of the following type(s) are allowed in the list [Social](#)

java.lang.String getSpouseName ()

Gets the value of the spouseName property.

Returns:

possible object is [java.lang.String](#)

java.lang.String getStartGreeting ()

Gets the value of the startGreeting property.

Returns:

possible object is [java.lang.String](#)

[L10NString](#) getSuffix ()

Gets the value of the suffix property.

Returns:

possible object is [L10NString](#)

[L10NString](#) getType ()

Gets the value of the type property.

Returns:

possible object is [L10NString](#)

java.util.List<[Website](#)> getWebsite ()

Gets the value of the website property.

This accessor method returns a reference to the live list, not a snapshot. Therefore any modification you make to the returned list will be present inside the JAXB object. This is why there is not a `set` method for the website property.

For example, to add a new item, do as follows:

```
getWebsite().add(newItem);
```

Objects of the following type(s) are allowed in the list [Website](#)

Boolean isSystemCreated ()

Gets the value of the isSystemCreated property.

Returns:

possible object is [Boolean](#)

void setContactOrder (Integer value)

Sets the value of the contactOrder property.

Parameters:

<i>value</i>	allowed object is Integer
--------------	---

void setContactPoints ([ContactPoints](#) value)

Sets the value of the contactPoints property.

Parameters:

<i>value</i>	allowed object is ContactPoints
--------------	---

void setCustomAttributes ([CustomAttributes](#) value)

Sets the value of the customAttributes property.

Parameters:

<i>value</i>	allowed object is CustomAttributes
--------------	--

void setDateOfBirth (java.lang.String value)

Sets the value of the dateOfBirth property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setDependents (java.lang.String value)

Sets the value of the dependents property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setEducationLevel ([L10NString](#) value)

Sets the value of the educationLevel property.

Parameters:

<i>value</i>	allowed object is L10NString
--------------	--

void setEmergencyContact (java.lang.String value)

Sets the value of the emergencyContact property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setEmploymentStatus ([L10NString](#) value)

Sets the value of the employmentStatus property.

Parameters:

<i>value</i>	allowed object is L10NString
--------------	--

void setEndGreeting (java.lang.String value)

Sets the value of the endGreeting property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setFirstName (java.lang.String *value*)

Sets the value of the firstName property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setFirstNameFurigana (java.lang.String *value*)

Sets the value of the firstNameFurigana property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setGender ([L10NString](#) *value*)

Sets the value of the gender property.

Parameters:

<i>value</i>	allowed object is L10NString
--------------	--

void setHasDirectCallingConsent (java.lang.String *value*)

Sets the value of the hasDirectCallingConsent property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setHasDirectMailingConsent (java.lang.String *value*)

Sets the value of the hasDirectMailingConsent property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setHasHoldingDataConsent (java.lang.String *value*)

Sets the value of the hasHoldingDataConsent property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setHobbies (java.lang.String *value*)

Sets the value of the hobbies property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setId (long *value*)

Sets the value of the id property.

Parameters:

<i>value</i>	allowed object is Long
--------------	--

void setIdentification ([Identification](#) value)

Sets the value of the identification property.

Parameters:

<i>value</i>	allowed object is Identification
--------------	--

void setIncomeLevel (java.lang.String value)

Sets the value of the incomeLevel property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setInitials (java.lang.String value)

Sets the value of the initials property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setInterests (java.lang.String value)

Sets the value of the interests property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setIsSmoker (java.lang.String value)

Sets the value of the isSmoker property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setIsSystemCreated (Boolean value)

Sets the value of the isSystemCreated property.

Parameters:

<i>value</i>	allowed object is Boolean
--------------	---

void setJobTitle (java.lang.String value)

Sets the value of the jobTitle property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setLastModified ([DateAndUser](#) value)

Sets the value of the lastModified property.

Parameters:

<i>value</i>	allowed object is DateAndUser
--------------	---

void setLastName (java.lang.String value)

Sets the value of the lastName property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setLastNameFurigana (java.lang.String *value*)

Sets the value of the lastNameFurigana property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setLoginId (java.lang.String *value*)

Sets the value of the loginId property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setMaritalStatus ([L10NString](#) *value*)

Sets the value of the maritalStatus property.

Parameters:

<i>value</i>	allowed object is L10NString
--------------	--

void setMiddleName (java.lang.String *value*)

Sets the value of the middleName property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setMiddleNameFurigana (java.lang.String *value*)

Sets the value of the middleNameFurigana property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setOccupation (java.lang.String *value*)

Sets the value of the occupation property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setPriority (java.lang.String *value*)

Sets the value of the priority property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setRace (java.lang.String *value*)

Sets the value of the race property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setSalutation (java.lang.String value)

Sets the value of the salutation property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setSecretAnswer (java.lang.String value)

Sets the value of the secretAnswer property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setSecretQuestion (java.lang.String value)

Sets the value of the secretQuestion property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setSpouseName (java.lang.String value)

Sets the value of the spouseName property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setStartGreeting (java.lang.String value)

Sets the value of the startGreeting property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setSuffix ([L10NString](#) value)

Sets the value of the suffix property.

Parameters:

<i>value</i>	allowed object is L10NString
--------------	--

void setType ([L10NString](#) value)

Sets the value of the type property.

Parameters:

<i>value</i>	allowed object is L10NString
--------------	--

Detailed Description

ContactPerson Schema

This schema contains [ContactPerson](#) type details.

XML Schema File

model/v15/xsd/interaction/contact_person.xsd

Name	Description	Type
id	ID of the requested contact person	Long
self	Attribute to identify whether the contact is the logged in contact	String
isSystemCreated	Field to convey if the contact person is system created	Boolean
salutation	Salutation of the contact person	String
firstName	First name of the contact person	String
middleName	Middle name of the contact person	String
lastName	Last name of the contact person	String
loginId	Login ID of the contact person	String
lastModified	Last modification details of the contact person	DateAndUser
jobTitle	Job Title of the contact person	String
employmentStatus	Employment status of the contact person	L10NString
dateOfBirth	Date of birth of the contact person	DateTime
gender	Gender of the contact person	L10NString
maritalStatus	Marital status of the contact person	L10NString
identification	Identification details of the contact person	Identification
type	Contact person's type (e.g. billing, legal, shipping etc.)	L10NString
firstNameFurigana	String to specify how the first name of the contact person should be pronounced	String
middleNameFurigana	String to specify how the middle name of the contact person should be pronounced	String
lastNameFurigana	String to specify how the last name of the contact person should be pronounced	String
suffix	Suffix to use for the contact person	L10NString
initials	Initials of the contact person	String
startGreeting	String to specify start greeting to use for the contact person	String
endGreeting	String to specify end greeting to use for the contact person	String

spouseName	Name of spouse of the contact person	String
emergencyContact	Emergency Contact information of the contact person	String
priority	Priority of the contact person	String
secretQuestion	Secret question which should be asked to the contact person if he forgets his password	String
secretAnswer	Name and value of all the custom attributes configured for the Customer Object	String
occupation	Occupation of the contact person	String
incomeLevel	Income level of the contact person	String
educationLevel	Education level of the contact person	L10NString
race	Race of the contact person	String
dependents	Dependents of the contact person	String
isSmoker	Field to convey if the contact person is a smoker	Boolean
hobbies	Hobbies of the contact person	String
interests	Interests of the contact person	String
contactOrder	Number specifying the order in which this contact person should be contacted if there are more than one contact persons for the same customer	Int
hasDirectMailingConsent	Field to convey if direct mailing consent is given by the contact person	Boolean
hasDirectCallingConsent	Field to convey if direct calling consent is given by the contact person	Boolean
hasHoldingDataConsent	Field to convey if holding data consent is given by the contact person	Boolean
customAttributes	Name and value of all the custom attributes configured for the Contact Person Object	CustomAttributes
contactPoints	Details of all contact points associated with the contact person	ContactPoints
email	Details of all email contact points associated with the contact person (only for customer access)	Email
postal	Details of all postal contact	Postal

	points associated with the contact person (only for customer access)	
phone	Details of all phone contact points associated with the contact person (only for customer access)	Phone
website	Details of all website type contact points associated with the contact person (only for customer access)	Website
social	Details of all social type contact points associated with the contact person (only for customer access)	Social

Member Function Documentation

Integer getContactOrder ()

Gets the value of the contactOrder property.

Returns:

possible object is [Integer](#)

[ContactPoints](#) getContactPoints ()

Gets the value of the contactPoints property.

Returns:

possible object is [ContactPoints](#)

[CustomAttributes](#) getCustomAttributes ()

Gets the value of the customAttributes property.

Returns:

possible object is [CustomAttributes](#)

java.lang.String getDateOfBirth ()

Gets the value of the dateOfBirth property.

Returns:

possible object is [java.lang.String](#)

java.lang.String getDependents ()

Gets the value of the dependents property.

Returns:

possible object is [java.lang.String](#)

[L10NString](#) getEducationLevel ()

Gets the value of the educationLevel property.

Returns:

possible object is [L10NString](#)

java.util.List<[Email](#)> getEmail ()

Gets the value of the email property.

This accessor method returns a reference to the live list, not a snapshot. Therefore any modification you make to the returned list will be present inside the JAXB object. This is why there is not a set method for the email property.

For example, to add a new item, do as follows:

```
getEmail().add(newItem);
```

Objects of the following type(s) are allowed in the list [Email](#)

java.lang.String getEmergencyContact ()

Gets the value of the emergencyContact property.

Returns:

possible object is [java.lang.String](#)

[L10NString](#) getEmploymentStatus ()

Gets the value of the employmentStatus property.

Returns:

possible object is [L10NString](#)

java.lang.String getEndGreeting ()

Gets the value of the endGreeting property.

Returns:

possible object is [java.lang.String](#)

java.lang.String getFirstName ()

Gets the value of the firstName property.

Returns:

possible object is [java.lang.String](#)

java.lang.String getFirstNameFurigana ()

Gets the value of the firstNameFurigana property.

Returns:

possible object is [java.lang.String](#)

[L10NString](#) getGender ()

Gets the value of the gender property.

Returns:

possible object is [L10NString](#)

java.lang.String getHasDirectCallingConsent ()

Gets the value of the hasDirectCallingConsent property.

Returns:

possible object is [java.lang.String](#)

java.lang.String getHasDirectMailingConsent ()

Gets the value of the hasDirectMailingConsent property.

Returns:

possible object is [java.lang.String](#)

java.lang.String getHasHoldingDataConsent ()

Gets the value of the hasHoldingDataConsent property.

Returns:

possible object is [java.lang.String](#)

java.lang.String getHobbies ()

Gets the value of the hobbies property.

Returns:

possible object is [java.lang.String](#)

long getId ()

Gets the value of the id property.

Returns:

possible object is [Long](#)

[Identification](#) getIdentification ()

Gets the value of the identification property.

Returns:

possible object is [Identification](#)

java.lang.String getIncomeLevel ()

Gets the value of the incomeLevel property.

Returns:

possible object is [java.lang.String](#)

java.lang.String getInitials ()

Gets the value of the initials property.

Returns:

possible object is [java.lang.String](#)

java.lang.String getInterests ()

Gets the value of the interests property.

Returns:

possible object is [java.lang.String](#)

java.lang.String getIsSmoker ()

Gets the value of the isSmoker property.

Returns:

possible object is [java.lang.String](#)

java.lang.String getJobTitle ()

Gets the value of the jobTitle property.

Returns:

possible object is [java.lang.String](#)

[DateAndUser](#) getLastModified ()

Gets the value of the lastModified property.

Returns:

possible object is [DateAndUser](#)

java.lang.String getLastName ()

Gets the value of the lastName property.

Returns:

possible object is [java.lang.String](#)

java.lang.String getLastNameFurigana ()

Gets the value of the lastNameFurigana property.

Returns:

possible object is [java.lang.String](#)

java.lang.String getLoginId ()

Gets the value of the loginId property.

Returns:

possible object is [java.lang.String](#)

[L10NString](#) getMaritalStatus ()

Gets the value of the maritalStatus property.

Returns:

possible object is [L10NString](#)

java.lang.String getMiddleName ()

Gets the value of the middleName property.

Returns:

possible object is [java.lang.String](#)

java.lang.String getMiddleNameFurigana ()

Gets the value of the middleNameFurigana property.

Returns:

possible object is [java.lang.String](#)

java.lang.String getOccupation ()

Gets the value of the occupation property.

Returns:

possible object is [java.lang.String](#)

java.util.List<Phone> getPhone ()

Gets the value of the phone property.

This accessor method returns a reference to the live list, not a snapshot. Therefore any modification you make to the returned list will be present inside the JAXB object. This is why there is not a `set` method for the phone property.

For example, to add a new item, do as follows:

```
getPhone().add(newItem);
```

Objects of the following type(s) are allowed in the list [Phone](#)

java.util.List<Postal> getPostal ()

Gets the value of the postal property.

This accessor method returns a reference to the live list, not a snapshot. Therefore any modification you make to the returned list will be present inside the JAXB object. This is why there is not a `set` method for the postal property.

For example, to add a new item, do as follows:

```
getPostal().add(newItem);
```

Objects of the following type(s) are allowed in the list [Postal](#)

java.lang.String getPriority ()

Gets the value of the priority property.

Returns:

possible object is [java.lang.String](#)

java.lang.String getRace ()

Gets the value of the race property.

Returns:

possible object is [java.lang.String](#)

java.lang.String getSalutation ()

Gets the value of the salutation property.

Returns:

possible object is [java.lang.String](#)

java.lang.String getSecretAnswer ()

Gets the value of the secretAnswer property.

Returns:

possible object is [java.lang.String](#)

java.lang.String getSecretQuestion ()

Gets the value of the secretQuestion property.

Returns:

possible object is [java.lang.String](#)

java.lang.String getSelf ()

Gets the value of the self property.

Returns:

possible object is [java.lang.String](#)

java.util.List<[Social](#)> getSocial ()

Gets the value of the social property.

This accessor method returns a reference to the live list, not a snapshot. Therefore any modification you make to the returned list will be present inside the JAXB object. This is why there is not a `set` method for the social property.

For example, to add a new item, do as follows:

```
getSocial().add(newItem);
```

Objects of the following type(s) are allowed in the list [Social](#)

java.lang.String getSpouseName ()

Gets the value of the spouseName property.

Returns:

possible object is [java.lang.String](#)

java.lang.String getStartGreeting ()

Gets the value of the startGreeting property.

Returns:

possible object is [java.lang.String](#)

[L10NString](#) getSuffix ()

Gets the value of the suffix property.

Returns:

possible object is [L10NString](#)

[L10NString](#) getType ()

Gets the value of the type property.

Returns:

possible object is [L10NString](#)

java.util.List<[Website](#)> getWebsite ()

Gets the value of the website property.

This accessor method returns a reference to the live list, not a snapshot. Therefore any modification you make to the returned list will be present inside the JAXB object. This is why there is not a `set` method for the website property.

For example, to add a new item, do as follows:

```
getWebsite().add(newItem);
```

Objects of the following type(s) are allowed in the list [Website](#)

Boolean isSystemCreated ()

Gets the value of the isSystemCreated property.

Returns:

possible object is [Boolean](#)

void setContactOrder (Integer value)

Sets the value of the contactOrder property.

Parameters:

<i>value</i>	allowed object is Integer
--------------	---

void setContactPoints ([ContactPoints](#) value)

Sets the value of the contactPoints property.

Parameters:

<i>value</i>	allowed object is ContactPoints
--------------	---

void setCustomAttributes ([CustomAttributes](#) value)

Sets the value of the customAttributes property.

Parameters:

<i>value</i>	allowed object is CustomAttributes
--------------	--

void setDateOfBirth (java.lang.String value)

Sets the value of the dateOfBirth property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setDependents (java.lang.String value)

Sets the value of the dependents property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setEducationLevel ([L10NString](#) value)

Sets the value of the educationLevel property.

Parameters:

<i>value</i>	allowed object is L10NString
--------------	--

void setEmergencyContact (java.lang.String value)

Sets the value of the emergencyContact property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setEmploymentStatus ([L10NString](#) value)

Sets the value of the employmentStatus property.

Parameters:

<i>value</i>	allowed object is L10NString
--------------	--

void setEndGreeting (java.lang.String value)

Sets the value of the endGreeting property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setFirstName (java.lang.String value)

Sets the value of the firstName property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setFirstNameFurigana (java.lang.String value)

Sets the value of the firstNameFurigana property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setGender ([L10NString](#) value)

Sets the value of the gender property.

Parameters:

<i>value</i>	allowed object is L10NString
--------------	--

void setHasDirectCallingConsent (java.lang.String value)

Sets the value of the hasDirectCallingConsent property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setHasDirectMailingConsent (java.lang.String value)

Sets the value of the hasDirectMailingConsent property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setHasHoldingDataConsent (java.lang.String value)

Sets the value of the hasHoldingDataConsent property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setHobbies (java.lang.String value)

Sets the value of the hobbies property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setId (long *value*)

Sets the value of the id property.

Parameters:

<i>value</i>	allowed object is Long
--------------	--

void setIdentification ([Identification](#) *value*)

Sets the value of the identification property.

Parameters:

<i>value</i>	allowed object is Identification
--------------	--

void setIncomeLevel (java.lang.String *value*)

Sets the value of the incomeLevel property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setInitials (java.lang.String *value*)

Sets the value of the initials property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setInterests (java.lang.String *value*)

Sets the value of the interests property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setIsSmoker (java.lang.String *value*)

Sets the value of the isSmoker property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setIsSystemCreated (Boolean *value*)

Sets the value of the isSystemCreated property.

Parameters:

<i>value</i>	allowed object is Boolean
--------------	---

void setJobTitle (java.lang.String *value*)

Sets the value of the jobTitle property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setLastModified ([DateAndUser](#) value)

Sets the value of the lastModified property.

Parameters:

<i>value</i>	allowed object is DateAndUser
--------------	---

void setLastName (java.lang.String value)

Sets the value of the lastName property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setLastNameFurigana (java.lang.String value)

Sets the value of the lastNameFurigana property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setLoginId (java.lang.String value)

Sets the value of the loginId property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setMaritalStatus ([L10NString](#) value)

Sets the value of the maritalStatus property.

Parameters:

<i>value</i>	allowed object is L10NString
--------------	--

void setMiddleName (java.lang.String value)

Sets the value of the middleName property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setMiddleNameFurigana (java.lang.String value)

Sets the value of the middleNameFurigana property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setOccupation (java.lang.String value)

Sets the value of the occupation property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setPriority (java.lang.String value)

Sets the value of the priority property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setRace (java.lang.String *value*)

Sets the value of the race property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setSalutation (java.lang.String *value*)

Sets the value of the salutation property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setSecretAnswer (java.lang.String *value*)

Sets the value of the secretAnswer property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setSecretQuestion (java.lang.String *value*)

Sets the value of the secretQuestion property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setSelf (java.lang.String *value*)

Sets the value of the self property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setSpouseName (java.lang.String *value*)

Sets the value of the spouseName property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setStartGreeting (java.lang.String *value*)

Sets the value of the startGreeting property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setSuffix ([L10NString](#) *value*)

Sets the value of the suffix property.

Parameters:

<i>value</i>	allowed object is L10NString
--------------	--

void setType ([L10NString](#) value)

Sets the value of the type property.

Parameters:

<i>value</i>	allowed object is L10NString
--------------	--

count	Total count of contact persons	Int

Member Function Documentation

java.util.List<[ContactPerson](#)> [getContactPerson](#) ()

Gets the value of the contactPerson property.

This accessor method returns a reference to the live list, not a snapshot. Therefore any modification you make to the returned list will be present inside the JAXB object. This is why there is not a `set` method for the contactPerson property.

For example, to add a new item, do as follows:

```
getContactPerson().add(newItem);
```

Objects of the following type(s) are allowed in the list [ContactPerson](#)

BigInteger [getCount](#) ()

Gets the value of the count property.

Returns:

possible object is [BigInteger](#)

[Link](#) [getLink](#) ()

Gets the value of the link property.

Returns:

possible object is [Link](#)

void setCount (BigInteger value)

Sets the value of the count property.

Parameters:

<i>value</i>	allowed object is BigInteger
--------------	--

void setLink ([Link](#) value)

Sets the value of the link property.

Parameters:

<i>value</i>	allowed object is Link
--------------	--

- void [setCount](#) (BigInteger value)
- void [setLink](#) ([Link](#) value)

Detailed Description

ContactPersons Schema

This schema contains [ContactPersons](#) type details.

XML Schema File

model/v15/xsd/interaction/contact_person.xsd

Name	Description	Type
link	self link	Link
contactPerson	Contact Person details	ContactPerson
count	Total count of contact persons	Int

Member Function Documentation

java.util.List<[ContactPerson](#)> [getContactPerson](#) ()

Gets the value of the contactPerson property.

This accessor method returns a reference to the live list, not a snapshot. Therefore any modification you make to the returned list will be present inside the JAXB object. This is why there is not a `set` method for the contactPerson property.

For example, to add a new item, do as follows:

```
getContactPerson().add(newItem);
```

Objects of the following type(s) are allowed in the list [ContactPerson](#)

BigInteger [getCount](#) ()

Gets the value of the count property.

Returns:

possible object is [BigInteger](#)

[Link](#) [getLink](#) ()

Gets the value of the link property.

Returns:

possible object is [Link](#)

void setCount (BigInteger value)

Sets the value of the count property.

Parameters:

<i>value</i>	allowed object is BigInteger
--------------	--

void setLink ([Link](#) value)

Sets the value of the link property.

Parameters:

<i>value</i>	allowed object is Link
--------------	--

customAttributes	Name and value of all the custom attributes configured for the Contact Point Object	CustomAttributes

Member Function Documentation

[CustomAttributes](#) [getCustomAttributes](#) ()

Gets the value of the customAttributes property.

Returns:

possible object is [CustomAttributes](#)

long [getId](#) ()

Gets the value of the id property.

Returns:

possible object is [Long](#)

[DateAndUser](#) getLastModified ()

Gets the value of the lastModified property.

Returns:

possible object is [DateAndUser](#)

[L10NString](#) getPriority ()

Gets the value of the priority property.

Returns:

possible object is [L10NString](#)

[Type](#) getType ()

Gets the value of the type property.

Returns:

possible object is [Type](#)

void setCustomAttributes ([CustomAttributes](#) value)

Sets the value of the customAttributes property.

Parameters:

<i>value</i>	allowed object is CustomAttributes
--------------	--

void setId (long value)

Sets the value of the id property.

Parameters:

<i>value</i>	allowed object is Long
--------------	--

void setLastModified ([DateAndUser](#) value)

Sets the value of the lastModified property.

Parameters:

<i>value</i>	allowed object is DateAndUser
--------------	---

void setPriority ([L10NString](#) value)

Sets the value of the priority property.

Parameters:

<i>value</i>	allowed object is L10NString
--------------	--

void setType ([Type](#) value)

Sets the value of the type property.

Parameters:

<i>value</i>	allowed object is Type
--------------	--

ContextCaseCommonInfoPage Class Reference

Detailed Description

Supported values of some Common Query Parameters that appear in Case Resource APIs

NOTE: each *common parameter* described below is not necessarily supported by all Case APIs. Therefore, first refer to specific API documentation to see which *common parameters* that API supports.

Values of \$attribute common parameter supported by Case Resource

Use `$attribute` to request additional attributes/elements of resource representation, beyond those always returned by server. The value of `$attribute` must be a comma separated list of attribute names. For example,

```
GET .../context/interaction/case/1000?$attribute=created
```

```
GET .../context/interaction/case/1000?$attribute=created,recentActivityDate,custom.abc
```

```
GET .../context/interaction/case/1000?$attribute=all
```

Name	Description	Schema/type returned by server
all	This is a special keyword that prompts server to return all available resource attributes	N/A
created	Case creation date	DateAndUser
recentActivityDate	Date of creation of the most recently created activity in the case.	DateTime
unreadActivityCount	Total number of unread activities in the case.	Int
custom.<name>	Name of a custom attribute configured for case object	CustomAttributes

Values of \$sort common parameter supported by Case Resource

Cases returned in server response are sorted based on the attribute supplied under `$sort`. See *Description* column below for specifics.

Name	Description
id	Results are sorted on case IDs
recentActivity	Results are sorted on date of creation of most recently created activities in the case. If

	activityMode query parameter is specified in the request, then only the creation dates of activities in the specified mode will be considered during sorting.that \$order system parameter value must be sent as 'desc' for the results to contain most recent cases at the top.
--	--

Summary attributes of Case Resource

Case Resource always returns <cases> representation, that contains one or more <case> representations and <paginationInfo> element if applicable.

Case summary

Name	Description	Schema/type
id	Case ID	Long
link	Self link that can be used to retrieve this case	Link
activities	Field holding a link that can be used to retrieve all activities of this case	Activities
status	Status of the case	L10NString
customer	Customer associated with the case (ID, name and self-link). This attribute will be returned only if the case belongs to the logged in customer.	Customer
subject	Case subject	String

ContextCustomerCommonInfoPage Class Reference

Detailed Description

Supported values of some Common Query Parameters that appear in Customer Resource APIs

NOTE: each *common parameter* described below is not necessarily supported by all Customer APIs. Therefore, first refer to specific API documentation to see which *common parameters* that API supports.

Values of \$attribute common parameter supported by Customer Resource

Use `$attribute` to request additional attributes/elements of resource representation, beyond those always returned by server. The value of `$attribute` must be a comma separated list of attribute names. For example,

```
GET .../context/interaction/customer?$attribute=role
```

```
GET .../context/interaction/customer?$attribute=industry,marketSegment,cus  
tom.abc
```

```
GET .../context/interaction/customer?$attribute=all
```

Name	Description	Schema/type returned by server
all	This is a special keyword that prompts server to return all available resource attributes. All attributes listed in this table as well as contact-additional-attributes will be returned.	N/A
role	Role of the customer (e.g., partner, reseller, customer)	L1ONString
pin	Customer pin information	String
industry	Industry that this customer belongs to	L1ONString
marketSegment	Market segment of the customer	String
entitlements	Entitlements of the customer	String
custom.<name>	Name of a custom attribute configured for customer object	CustomAttributes

Summary attributes of Customer Resource

Customer Resource always returns <customers> representation, that contains one or more <customer> representations and <paginationInfo> element if applicable.

Customer summary

Name	Description	Type
id	Customer ID	Long
link	Self link that can be used to retrieve this customer	Link
cases	Field holding a link that can be used to retrieve all cases of this customer	Cases
customerName	Customer name	String
type	Type and type-specific details of the customer	Type
lastModified	Details of the last modification of the customer (date only)	DateAndUser
contacts	All contacts of this customer. This representation contains one or more <contact> elements. See Contact summary below for details.	Contacts

Contact summary

Name	Description	Type
id	Contact ID	Long
firstName	Contact's first name	String
middleName	Contact's middle name	String
lastName	Contact's last name	String
lastModified	Details of the last modification of this contact (date only)	DateAndUser
email	Email details of this contact (ID, emailAddress and lastModified). <contact> element can contain one or more <email> elements.	Email
postal	Postal details of this contact (ID, type, address_1, address_2, city, state, zip, country, region and lastModified). <contact> element can contain one or more <postal> elements.	Postal

phone	Phone details of this contact (ID, type, phoneNo, countryCode, areaCode, extension and lastModified). <contact> element can contain one or more <phone> elements.	Phone
website	Website details of this contact (ID, url and lastModified). <contact> element can contain one or more <website> elements.	Website
social	Social details of this contact (ID, type, socialId and lastModified). <contact> element can contain one or more <social> elements.	Social

Additional attributes of Customer Resource

Below are additional attributes of Contact representations that are returned by server if \$attribute=all is requested by client. None of the below attributes can be requested by name. If \$attribute=all is not supplied in client request, only summary attributes are returned for [Contact](#) representation. However, if \$attribute=all is provided, both summary and all additional attributes of Contact are returned in server response.

Additional Attributes of Contact

The following additional contact attributes are returned under *customers -> customer -> contacts->contact* element in server response.

Name	Description	Type/schema returned by server
salutation	Contact's salutation	String
gender	Contact's gender	L10NString
identification	Identification details of the contact	Identification
suffix	Contact's suffix	L10NString
initials	Contact's initials	String
secretQuestion	Secret question for password retrieval	String
secretAnswer	Answer to the secret question	String
hasDirectMailingConsent	A flag indicating whether direct mailing consent is given by the contact	Boolean
hasDirectCallingConsent	A flag indicating whether	Boolean

	direct calling consent is given by the contact	
hasHoldingDataConsent	A flag indicating whether holding data consent is given by the contact	Boolean
jobTitle	Contact's job title	String
employmentStatus	Contact's employment status	L10NString
priority	Priority of this contact	String
dateOfBirth	Contact's date of birth	DateTime
maritalStatus	Marital status of the contact	L10NString
type	Contact's type (e.g. billing, legal, shipping etc.)	L10NString
firstNameFurigana	Contact's first name in furigana	String
middleNameFurigana	Contact's middle name in furigana	String
lastNameFurigana	Contact's last name in furigana	String
startGreeting	String specifying start of greeting to use for this contact	String
endGreeting	String specifying end of greeting to use for this contact	String
spouseName	Spouse name of the contact	String
emergencyContact	Emergency contact information of the contact	String
occupation	Contact's occupation	String
incomeLevel	Contact's income level	String
educationLevel	Contact's education level	L10NString
race	Contact's race	String
dependents	Dependents of the contact	String
isSmoker	A flag indicating whether this contact is a smoker	Boolean
hobbies	Contact's hobbies	String
interests	Contact's interests	String
contactOrder	Order in which this contact should be contacted if there are multiple contacts for the same customer	Int
customAttributes	All custom attributes available for this contact	CustomAttributes

Member Function Documentation

[ContactPerson](#) getContact ()

Gets the value of the contact property.

Returns:

possible object is [ContactPerson](#)

java.lang.String getCurrency ()

Gets the value of the currency property.

Returns:

possible object is [java.lang.String](#)

java.lang.String getNumberOfEmployees ()

Gets the value of the numberOfEmployees property.

Returns:

possible object is [java.lang.String](#)

java.lang.String getRegion ()

Gets the value of the region property.

Returns:

possible object is [java.lang.String](#)

java.lang.String getRegistrationNumber ()

Gets the value of the registrationNumber property.

Returns:

possible object is [java.lang.String](#)

java.lang.String getRevenues ()

Gets the value of the revenues property.

Returns:

possible object is [java.lang.String](#)

java.lang.String getSector ()

Gets the value of the sector property.

Returns:

possible object is [java.lang.String](#)

void setContact ([ContactPerson](#) value)

Sets the value of the contact property.

Parameters:

<i>value</i>	allowed object is ContactPerson
--------------	---

void setCurrency (java.lang.String value)

Sets the value of the currency property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setNumberOfEmployees (java.lang.String *value*)

Sets the value of the numberOfEmployees property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setRegion (java.lang.String *value*)

Sets the value of the region property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setRegistrationNumber (java.lang.String *value*)

Sets the value of the registrationNumber property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setRevenues (java.lang.String *value*)

Sets the value of the revenues property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setSector (java.lang.String *value*)

Sets the value of the sector property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

--------------	--

void setNumberOfEmployees (java.lang.String *value*)

Sets the value of the numberOfEmployees property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setRegion (java.lang.String *value*)

Sets the value of the region property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setRegistrationNumber (java.lang.String *value*)

Sets the value of the registrationNumber property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setRevenues (java.lang.String *value*)

Sets the value of the revenues property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setSector (java.lang.String *value*)

Sets the value of the sector property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

 - void [setLink](#) ([Link](#) value)
-

Detailed Description

countAndLink Schema

This schema has the definition of countAndLink.

XML Schema File

model/v12/xsd/interaction/activity.xsd

Name	Description	Type
count	Indicates number of objects.	Long
link	Link to the resource.	Link

Member Function Documentation

Long [getCount](#) ()

Gets the value of the count property.

Returns:

possible object is [Long](#)

[Link](#) [getLink](#) ()

Gets the value of the link property.

Returns:

possible object is [Link](#)

void [setCount](#) (Long *value*)

Sets the value of the count property.

Parameters:

<i>value</i>	allowed object is Long
--------------	--

void [setLink](#) ([Link](#) *value*)

Sets the value of the link property.

Parameters:

<i>value</i>	allowed object is Link
--------------	--

CreateContactPersonPage Class Reference

Detailed Description

Create Contact Person

Overview

This section contains the required and optional elements for contact person. A single contact person can be created for an individual customer and multiple contact persons can be created for group and corporate customers. One contact person can contain multiple contact points.

Elements required in request body

Name	Description
firstName	Must not exceed 124 characters.

Optional elements allowed in request body

Name	Description
salutation	Must be one of 'Mr.', 'Mrs.', 'Ms.', or 'Miss'.
middleName	Must not exceed 124 characters.
lastName	Must not exceed 124 characters
loginId	Must not exceed 255 characters.
gender.value	Must be 'male' or 'female'.
identification.type	Must be one of the values configured in application.
identification.value	Must not exceed 255 characters.
suffix.value	Must be one of jr., sr., i, ii, and iii.
initials	Must not exceed 16 characters.
secretQuestion	Must not exceed 255 characters.
secretAnswer	Must not exceed 255 characters.
hasDirectMailingConsent	Must be true or false.
hasDirectCallingConsent	Must be true or false.
hasHoldingDataConsent	Must be true or false.
jobTitle	Must not exceed 255 characters.
employmentStatus.value	Must be one of part-time, full-time, temporary, contract,intern, or unemployed.
priority	Must not exceed 255 characters.
dateOfBirth	Must be a past date. Refer supported date format here .
maritalStatus.value	Must be one of married, single, separated, divorced, and widowed.

type.value	Must be one of the values configured in application.
firstNameFurigana	Must not exceed 124 characters.
middleNameFurigana	Must not exceed 124 characters.
lastNameFurigana	Must not exceed 124 characters.
startGreeting	Must not exceed 255 characters.
endGreeting	Must not exceed 255 characters.
spouseName	Must not exceed 512 characters.
emergencyContact	Must not exceed 50 characters.
occupation	Must not exceed 255 characters.
incomeLevel	Must not exceed 255 characters.
educationLevel.value	Must be one of high school, graduate, post graduate, or doctorate.
race	Must not exceed 255 characters.
dependents	Must not exceed 255 characters.
isSmoker	Must be true or false.
hobbies	Must not exceed 255 characters.
interests	Must not exceed 255 characters.
contactOrder	Numeric value less than 32768.
contactPoints	One or more contact points can be provided. For required and optional elements of contact point, refer Create Contact Point .
customAttributes	Name must match one of the custom attributes configured in application. If the custom attribute is configured as an enumeration, the value must be one of the predefined values.

CreateContactPointPage Class Reference

Detailed Description

Create Contact Point

Overview

This section contains the required and optional elements for contact point. Multiple contact points can be created for a contact person.

Email contact point

Elements required in request body

Name	Description
type.value	Must be "email".
type.email.emailAddress	Must be a valid email address or phone number. Refer Email Address definition for the valid email address format. "Customer departmentalization" setting is enabled in the application, the provided email address must not be associated with any existing contact points in the same department. "Customer departmentalization" setting is disabled in application, the provided email address must not be associated with any existing contact points in the application.

Optional elements allowed in request body

Name	Description
priority.value	Must be 'low', 'medium', or 'high'.
customAttributes	Name must match one of the custom attributes configured in application. If the custom attribute is configured as an enumeration, the value must be one of the predefined values.

Phone contact point

Elements required in request body

Name	Description
type.value	Must be "phone".

type.phone.type.value	This can be one of 'home', 'office', 'mobile', 'fax', or 'pager'.
type.phone.phoneNo	This accepts any string representation. It is the client's responsibility to send in the correct number. Must not exceed 40 characters.

Optional elements allowed in request body

Name	Description
type.phone.countryCode	Must be a number not exceeding 9 digits.
type.phone.areaCode	Must not exceed 10 characters.
type.phone.extension	Must not exceed 10 characters.
type.phone.availability.days.value	Must be one of weekdays, weekends, and 'any_day'.
type.phone.availability.times.value	Must be one of 'mornings', 'afternoons', 'evenings', 'day', and 'anytime'.
priority.value	Must be 'low', 'medium', or 'high'.
customAttributes	Name must match one of the custom attributes configured in application. If the custom attribute is configured as an enumeration, the value must be one of the predefined values.

Postal contact point

Elements required in request body

Name	Description
type.value	Must be "postal".
type.postal.type.value	Must be one of 'office', 'home', 'mailto', 'billto', or 'shipto'.
type.postal.address_1	Must not exceed 50 characters.

Optional elements allowed in request body

Name	Description
type.postal.address_2	Must not exceed 50 characters.
type.postal.city	Must not exceed 50 characters.
type.postal.state	Must not exceed 50 characters.
type.postal.zip	Must not exceed 50 characters.
type.postal.country	Must not exceed 50 characters.
type.postal.region	Must not exceed 50 characters.
priority.value	Must be 'low', 'medium', or 'high'.
customAttributes	Name must match one of the custom attributes configured in application. If the

	custom attribute is configured as an enumeration, the value must be one of the predefined values.
--	---

Web contact point

Elements required in request body

Name	Description
type.value	Must be "web".
type.website.url	Must not exceed 1024 characters.

Optional elements allowed in request body

Name	Description
priority.value	Must be 'low', 'medium', or 'high'.
customAttributes	Name must match one of the custom attributes configured in application. If the custom attribute is configured as an enumeration, the value must be one of the predefined values.

Social contact point

Elements required in request body

Name	Description
type.value	Must be "social".
type.social.type.value	Must be one of 'twitter', 'facebook', 'community', or 'other'.
type.socialId	Must not exceed 255 characters.

Optional elements allowed in request body

Name	Description
priority.value	Must be 'low', 'medium', or 'high'.
customAttributes	Name must match one of the custom attributes configured in application. If the custom attribute is configured as an enumeration, the value must be one of the predefined values.

CreateCorporateCustomerPage Class Reference

Detailed Description

Create Corporate Customer

Overview

This API allows user to create a corporate customer. A corporate customer can have multiple Contact Persons, and the Contact Person may have one or more Contact Points.

Only one customer can be created at a time.

Since:

11.6

APIs

Method	URL	Description
POST	/ws/v12/interaction/customer	Create corporate customer.

Authentication

Authentication is required. The client must be logged in to call this API. Each API request must contain X-egain-session request header returned by Login API.

Permissions

All of the following are required:

- User should have 'Create Customer' action.
- If "Customer departmentalization" setting is enabled in the application, then created customer must belong to either the user's home department, or to the department where the user is a foreign user.

Licenses

The logged in user must have the following licenses:

- ECE CIH Platform

Request

Request headers

Name	Description	Allowed values	Default value
X-egain-session	Session ID obtained	N/A	N/A

	from Login API response header		
Accept	Content type accepted by client.	application/xml or application/json	N/A
Content-Type	Media type sent by the client	application/xml or application/json	N/A
Accept-Language	Language locale accepted by client (used for locale specific fields in resource representation and in error responses)	Supported 'Accept-Language' header codes	default system language

Request Body

The request body is mandatory. Request body can be in either XML or JSON format:

Elements required in request body

Name	Description
department.name	Name of the department in which the customer should be created. Department name is required only If "Customer departmentalization" setting is enabled in the application.
type.value	Must be "corporate".
customerName	Must not exceed 124 characters.

Optional elements allowed in request body

Name	Description
level	Must be one of the values configured in application.
role	Must be one of 'Partner', 'Reseller', or 'Customer'.
Pin	Must not exceed 255 characters.
howReferred	Must be one of 'Website', 'Customer', 'Partner', 'Employee', or 'Reseller'.
industry	Must be one of the values configured in application.
marketSegment	Must not exceed 50 characters.
entitlements	Must not exceed 1024 characters.

customAttributes	Name must match one of the custom attributes configured in application. If the custom attribute is configured as an enumeration, the value must be one of the predefined values.
contactPersons.contactPerson	One or more contact persons can be provided. For required and optional elements of contact person, refer Create Contact Person .
type.corporate.region	Must be one of the values configured in application.
type.corporate.numberOfWorkers	Must not exceed 19 digits
type.corporate.revenues	Must not exceed 20 characters.
type.corporate.currency	Must not exceed 255 characters.
type.corporate.registrationNumber	Must not exceed 255 characters.
type.corporate.sector	Must not exceed 50 characters.

Request body XML schemas:

- [Customers Schema](#)

Supported API specific query parameters

None

Supported common query parameters

None

Response

Response headers

Name	Description	Possible values
X-again-session	Session ID of the current user session	N/A
Content-Type	Media type of response body	application/xml or application/json
Location	Location of the new created customer	N/A

Response body XML schemas:

- [Error](#) - used in case of error

HTTP status codes

Success Status codes

201 - Created

- The request was successfully executed.

Failure Status codes

400 - Bad Request

- Any query parameter is sent in the request.
- Request body does not contain the required elements.
- An unsupported element is present in the request body.
- Elements provided do not adhere to the rules stated in the [Request Body](#) section.
- Request body is empty.

401 - Unauthorized

- X-egain-session request header is missing.
- Session is invalid or expired.

403 - Forbidden

- The user does not have sufficient permissions. Refer [Permissions](#) section for details.

500 - Internal server error

Examples:

[Example 1 - Create customer with required elements](#)

[Example 2 - Create customer with all elements](#)

CreateCustomerGrantExamples Class Reference

Detailed Description

Examples for create grants on a customer

Example 1 - Provide grants to a single customer

This example demonstrates the following:

- Providing grant to a single customer.

XML

Request

Method	URL
POST	/ws/v12/interaction/customer/grant

Request headers

Name	Value
X-egain-session	Valid session ID
Accept	application/xml
Content-Type	application/xml
Accept-Language	en-US

Request body

```
<?xml version="1.0" encoding="UTF-8"?><grants
xmlns="http://bindings.egain.com/ws/model/v12/gen/interaction/customer">  <grantsOn>
<customer id="1000"/>  </grantsOn>  <grantsTo>  <customer id="1001"/>
</grantsTo></grants>
```

Response

HTTP/1.1 201 Created

Response headers

Name	Value
X-egain-session	current session ID
Content-Type	application/xml
Location	/system/ws/v12/interaction/customer/1000/grant

JSON

Request

Method	URL
POST	/ws/v12/interaction/customer/grant

Request headers

Name	Value
X-egain-session	Valid session ID
Accept	application/json
Content-Type	application/json
Accept-Language	en-US

Request body

```
{  "grantsOn": {    "customer": [      {        "id": "1000"      }    ]  },  "grantsTo": {    "customer": [      {        "id": "1001"      }    ]  } }
```

Response

HTTP/1.1 201 Created

Response headers

Name	Value
X-egain-session	current session ID
Content-Type	application/json
Location	/system/ws/v12/interaction/customer/1000/grant

Example 2 - Provide grants to multiple customers

This example demonstrates the following:

- providing grant to multiple customers (2 customers in this example).

XML

Request

Method	URL
POST	/ws/v12/interaction/customer/grant

Request headers

Name	Value
X-egain-session	Valid session ID
Accept	application/xml

Content-Type	application/xml
Accept-Language	en-US

Request body

```
<?xml version="1.0" encoding="UTF-8" standalone="yes" ?><grants
xmlns="http://bindings.egain.com/ws/model/v12/gen/interaction/customer">
  <grantsOn>
    <customer id="1000"/>
  </grantsOn>
  <grantsTo>
    <customer id="1002"/>
    <customer
id="1020"/>
  </grantsTo></grants>
```

Response

HTTP/1.1 201 Created

Response headers

Name	Value
X-egain-session	current session ID
Content-Type	application/xml
Location	/system/ws/v12/interaction/customer/1000/ grant

JSON

Request

Method	URL
POST	/ws/v12/interaction/customer /grant

Request headers

Name	Value
X-egain-session	Valid session ID
Accept	application/json
Content-Type	application/json
Accept-Language	en-US

Request body

```
{
  "grantsOn": {
    "customer": [
      {
        "id": "1000"
      }
    ]
  },
  "grantsTo": {
    "customer": [
      {
        "id": "1002"
      },
      {
        "id": "1020"
      }
    ]
  }
}
```

Response

HTTP/1.1 201 Created

Response headers

Name	Value
X-egain-session	current session ID
Content-Type	application/json
Location	/system/ws/v12/interaction/customer/1000/ grant

CreateCustomerGrantPage Class Reference

Detailed Description

Create customer grants

Overview

This API allows the user to provide grants on a customer to other customers. Refer [Customer grants](#) for information about what is a grant.

For the successful execution of this API:

1. The customer to whom grant is being provided, must be an individual customer.
2. The customer on whom the grant is being provided, must be an individual customer.
3. If the customer departmentalization is enabled in the application, both the customers must belong to the same department.
4. The number of customers to whom grants are being provided must not exceed 75.

Since:

11.6

APIs

Method	URL	Description
POST	/ws/v12/interaction/customer/grant	Provides grants on a customer to one or more customers.

Authentication

Authentication is required. The client must be logged in to call this API. Each API request must contain X-again-session request header returned by Login API.

Permissions

All of the following are required:

- User must have 'Edit Customer' action.
- If "Customer departmentalization" setting is enabled in the application, then all customers (granted on and granted to) must belong to either the user's home department, or to a department where the user is a foreign user.

Licenses

The logged in user must have the following licenses:

- ECE CIH Platform

Request

Request headers

Name	Description	Allowed values	Default value
X-egain-session	Session ID obtained from Login API response header	N/A	N/A
Accept	Content type accepted by client.	application/xml or application/json	N/A
Content-Type	Media type sent by the client	application/xml or application/json	N/A
Accept-Language	Language locale accepted by client (used for locale specific fields in resource representation and in error responses)	Supported 'Accept-Language' header codes	default system language

Request Body

The request body is mandatory. Request body can be in either XML or JSON format:

Elements required in request body

Name	Description
grantsOn.customer.id	Customer on whom the grants will be provided.
grantsTo.customer.id	This will specify the customers to whom the grant will be provided.

Optional elements allowed in request body

None

Request body XML schemas:

- [Grants Schema](#)

Supported API specific query parameters

None

Supported common query parameters

None

Response

Response headers

Name	Description	Possible values
X-egain-session	Session ID of the current user session	N/A
Content-Type	Media type of response body	application/xml or application/json
Location	URL listing the grants for the customer providing the grants	interaction/customer/{ID}/grant

Response body XML schemas:

- [Error](#) - used in case of error

HTTP status codes

Success Status codes

201 - Created

- The request was successfully executed.

Failure Status codes

400 - Bad Request

- Any query parameter is sent in the request.
- Request body does not contain the required elements.
- An unsupported element is present in the request body.
- Elements provided do not adhere to the rules stated in the [Request Body](#) section.
- Request body is empty.

401 - Unauthorized

- X-egain-session request header is missing.
- Session is invalid or expired.

403 - Forbidden

- The user does not have sufficient permissions. Refer [Permissions](#) section for details.

406 - Not Acceptable

- Invalid 'Accept-Language' header value

500 - Internal server error

Examples:

[Example 1 - Provide grants to a single customer](#)

Example 2 - Provide grants to multiple customers

Created Class Reference

Public Member Functions

- XMLGregorianCalendar [getDate](#) ()
 - [User](#) [getUser](#) ()
 - void [setDate](#) (XMLGregorianCalendar value)
 - void [setUser](#) ([User](#) value)
-

Detailed Description

Documentation to be added when the Authoring API is released.

Member Function Documentation

XMLGregorianCalendar [getDate](#) ()

Gets the value of the date property.

Returns:

possible object is [XMLGregorianCalendar](#)

[User](#) [getUser](#) ()

Gets the value of the user property.

Returns:

possible object is [User](#)

void [setDate](#) (XMLGregorianCalendar *value*)

Sets the value of the date property.

Parameters:

<i>value</i>	allowed object is XMLGregorianCalendar
--------------	--

void [setUser](#) ([User](#) *value*)

Sets the value of the user property.

Parameters:

<i>value</i>	allowed object is User
--------------	--

CreateEmailActivityResponseExamples Class Reference

Detailed Description

Examples for Create Incoming Email Activity

Example 1 - Create a secure email response with required elements, using XML/JSON content-type

Using XML/JSON as the content-type, this example demonstrates the following:

- Creating an email with required elements, subject and content.

XML

Request

Method	URL
POST	/ws/v15/context/interaction/activity/1000

Request headers

Name	Value
X-egain-session	Valid session ID
Accept	application/xml
Content-Type	application/xml
Accept-Language	en-US

Request body:

```
<?xml version="1.0" encoding="UTF-8"?> <activity
xmlns="http://bindings.egain.com/ws/model/v15/gen/interaction/activity"
xmlns:ns2="http://bindings.egain.com/ws/model/v15/gen/platform"
xmlns:ns3="http://bindings.egain.com/ws/model/v15/gen/common"
xmlns:ns4="http://bindings.egain.com/ws/model/v15/gen/interaction/attachment" > <type>
<value>email</value> <subtype> <ns3:value>general</ns3:value>
</subtype> </type> <subject>Issue with mobile phone</subject> <payload>
<email> <contents> <content> <ns3:type>text</ns3:type>
<ns3:value>This is the issue</ns3:value> </content> <content>
<ns3:type>html</ns3:type>
<ns3:value><![CDATA[<HTML><HEAD><TITLE></TITLE></HEAD><BODY><P>This is the issue <BR>
</P></BODY></HTML>]]></ns3:value> </content> </contents>
</email> </payload> </activity>
```

Response:

HTTP/1.1 201 Created

Response headers

Name	Value
X-egain-session	current session ID

Content-Type	application/xml
Location	/system/ws/v15/context/interaction/activity/2795

JSON

Request

Method	URL
POST	/ws/v15/context/interaction/activity/1000

Request headers :

Name	Value
X-egain-session	Valid session ID
Content-Type	application/json
Accept	application/json
Accept-Language	en-US

Request body:

```
{ "type": { "value": "email", "subtype": { "value": "general" } }, "subject": "Issue with mobile phone", "payload": { "email": { "contents": { "content": [ { "type": "text", "value": "This is the issue" }, { "type": "html", "value": "<HTML><HEAD><TITLE></TITLE></HEAD><BODY><P>This is the issue<BR> </P></BODY></HTML>" } ] } } }
```

Response:

HTTP/1.1 201 Created

Response headers

Name	Value
X-egain-session	current session ID
Content-Type	application/json
Location	/system/ws/v15/context/interaction/activity/2795

Example 2 - Create a secure email response with required elements, using Multipart/form-data content-type

Using "multipart/form-data" as the content-type, this example demonstrates the following:

- Creating an email with required elements, subject and content.

XML

Request

Method	URL
POST	/ws/v15/context/interaction/activity/1000

Request headers :

Name	Value
X-egain-session	Valid session ID
Content-Type	multipart/form-data; boundary=----WebKitFormBoundaryLyRAYGiE5mFu3Ucv
Accept	application/xml
Accept-Language	en-US

Request body:

```

-----WebKitFormBoundaryLyRAYGiE5mFu3UcvContent-Disposition: form-data; name="data" <?xml
version="1.0" encoding="UTF-8"?> <activity
xmlns="http://bindings.egain.com/ws/model/v15/gen/interaction/activity"
xmlns:ns2="http://bindings.egain.com/ws/model/v15/gen/platform"

<value>email</value> <subtype> <ns3:value>general</ns3:value>
</subtype> </type> <subject>Issue with mobile phone</subject> <payload>
<email> <contents> <content>
<ns3:type>html</ns3:type>
<ns3:value><![CDATA[<HTML><HEAD><TITLE></TITLE></HEAD><BODY><P>This is the issue <BR>
</P></BODY></HTML>]]></ns3:value> </content> </contents>
</email> </payload> </activity>
-----WebKitFormBoundaryLyRAYGiE5mFu3UcvContent-Disposition: form-data; name="data-type"
application/xml-----WebKitFormBoundaryLyRAYGiE5mFu3Ucv--

```

Response:

HTTP/1.1 201 Created

Response headers

Name	Value
X-egain-session	Current session ID
Content-Type	multipart/form-data; boundary=----WebKitFormBoundaryLyRAYGiE5mFu3Ucv
Location	/system/ws/v15/context/interaction/activity/2800

JSON

Request

Method	URL
POST	/ws/v15/context/interaction/activity/1000

Request headers :

Name	Value
------	-------

X-egain-session	Valid session ID
Content-Type	multipart/form-data; boundary=-----WebKitFormBoundaryLyRAYGiE5mFu3Ucv
Accept	application/json
Accept-Language	en-US

Request body:

```
-----WebKitFormBoundaryLyRAYGiE5mFu3UcvContent-Disposition: form-data; name="data" {  "type": {
"value": "email",    "subtype": {      "value": "general"    } }, "subject": "Issue with mobile
phone", "payload": {    "email": {      "contents": {        "content": [          {
"type": "html",      "value": "<HTML><HEAD><TITLE></TITLE></HEAD><BODY><P>This is the issue
<BR> </P></BODY></HTML>"          }        ]      }      }    }
}}-----WebKitFormBoundaryLyRAYGiE5mFu3UcvContent-Disposition: form-data; name="data-type"
application/json-----WebKitFormBoundaryLyRAYGiE5mFu3Ucv--
```

Response:

HTTP/1.1 201 Created

Response headers

Name	Value
X-egain-session	Current session ID
Content-Type	multipart/form-data; boundary=-----WebKitFormBoundaryLyRAYGiE5mFu3Ucv
Location	/system/ws/v15/context/interaction/activity /2800

Example 3 - Create a secure email response with inline and non-inline attachments, using XML/JSON content-type

Using XML/JSON as the content-type, this example demonstrates the following:

- Creating an email with required elements, message center ID, subject and content
- Representation of non-inline attachments in the request
- Representation of inline attachments in the request
- Creating an email with inline and non-inline attachments.

Note:

. isInline element is not present for the attachment with fileName laptop_issue.gif. Hence, this attachment will be treated as a non-inline attachment.

. isInline element is set to true for the attachment with contentId 14A6D171E20D4FD8A20D0D17B6C984CF@example.com. This attachment is being referred by the image in the email content using the [cid URL scheme](#). Hence, this attachment will be treated as an inline attachment for this email.

XML

Request

Method	URL
POST	/ws/v15/context/interaction/activity/1000

Request headers

Name	Value
X-egain-session	Valid session ID
Accept	application/xml
Content-Type	application/xml
Accept-Language	en-US

Request body:

```

```

Response:

HTTP/1.1 201 Created

Response headers

Name	Value
X-egain-session	current session ID
Content-Type	application/json
Location	/system/ws/v15/context/interaction/activity/2795

Example 4 - Create a secure email response with inline and non-inline attachment, using Multipart/form-data content-type

Using Multipart/form-data as content-type, this example demonstrates the following:

- Creating an email with required elements, message center ID, subject and content
- Representation of inline attachment in the request
- Representation of non-inline attachment in the request
- Creating an email with inline and non-inline attachments

Note:

. The 3rd body part has the Content-ID header with value 06FE0B5C60B94D0FA57450C77A18AB33@example.com. This body part is being referred by the image `` in the "data" part using the [cid URL scheme](#). Hence, the 3rd body part will be treated as an inline attachment for this email.

. Content-ID header is not present in the 4th body part. Hence, this part will be treated as a non-inline attachment.

CreateEmailActivityResponsePage Class Reference

Detailed Description

Create an email response

Overview

This API can be used by customers to create and send an email response to an existing activity. Only one activity can be responded to at a time.

Since

15.0.2

APIs

Method	URL	Description
POST	/ws/v15/context/interaction/activity/{ID}	Create an email response to an activity. {ID} is the ID of the existing activity.

Authentication

Authentication is required. The customer must be logged in to call this API. Each API request must contain X-egain-session request header returned by Login API.

Permissions

- All authenticated customers can access this API.
- If the query parameter customer={ID} is provided, the logged in customer must be authorized to perform this action on behalf of the customer specified through the "customer" query parameter. Otherwise, the application will return a 400 (bad request). Refer [Customer grants](#) Customer grants for more information about authorization.

Request

Request headers

Name	Description	Allowed values	Default value
X-egain-session	Session ID obtained from Login API response header	N/A	N/A
Content-Type	Media type sent by	application/x	N/A

	the client.	ml or application/j son or multipart/for m-data	
Accept	Content type accepted by the client.	application/x ml or application/j son	N/A
Accept-Language	Language locale accepted by client (used for locale specific fields in resource representation and in error responses)	Supported 'Accept-Language' header codes	default system language

Request Body

The request body is mandatory. The request body can be in one of the below two formats:

- XML / JSON representing the activity.
 - The activity can contain attachments which can be either inline or non-inline. Refer the [attachments Element](#) section for more details.
- Multipart form data.
 - The following two parts must be present:
 - . "data": This part must have the data representing the email activity. This can either be in XML format or JSON format.
 - . "data-type": This part identifies the data type of "data" part. It can have one of the two values - "application/json" or "application/xml".
 - .
 - Optionally there can be more parts that represent attachments of the activity. Each of these parts must contain one of the following headers:
 - . "Content-ID": Presence of Content-ID header implies that this is an inline attachment and the header contains the identifier for the attachment. This may additionally have a header by name "Content-Disposition", with "fileName" as a property.
 - a) The value of Content-ID must be enclosed within angular brackets (between '<' and '>'). For example, Content-ID: <image001.png@01D088BF.E1D8D780>.
 - . "Content-Disposition": "Content-Disposition" implies that this is a non-inline attachment. This must have a property by name "fileName" - This property contains the file name of the attachment. : If both Content-ID and Content-Disposition headers are present, the attachment will be treated as an inline attachment.

Note about inline attachments:

Inline attachments are supported using the [cid URL scheme](#). The cid URL scheme allows references to attachments from the email content. Refer [Example 3 - Create a secure email response with inline and non-inline attachments, using XML/JSON content-type](#) and [Example 4 - Create a secure email response with inline and non-inline attachment, using Multipart/form-data content-type](#) for details.

Elements required in the request body

Name	Description
type.value	Must be "email".
type.subtype.value	Must be "general".
subject or attachments or content	Must have atleast one of subject, attachments or content.

Optional elements allowed in the request body

Name	Description
payload.email.emailAddresses.from	<p>Specifies the sender's email address. this attribute is not provided, the application will automatically figure out the email address to use for the activity. provided, must be a single email address.</p> <ol style="list-style-type: none">1. If the query parameter "customer" is not provided:<ul style="list-style-type: none">• If this email address is present in the application, it must be associated with the logged in contact. If the email address is not present in the application, a new contact point with the provided email address will be created and used for activity creation.• If "Customer departmentalization" setting is enabled in the application, this email address will be looked up in the department of the customer.2. If the query parameter "customer" is provided, this attribute ("payload.email.emailAddresses.from") must not be provided. The application will automatically figure out the email address to use for the activity, since the activity is being created for a different customer.<ul style="list-style-type: none">• If the application does not find any email addresses for the customer provided through "customer" query parameter, the application will error out. It will not create a new email address for the customer
payload.email.emailAddresses.receiver	<p>Specifies the email address of an active email alias in application. The email activity is associated with this email alias.customer departmentalization setting is enabled, the alias must be in the same department as the customer. Must be a single email address.</p>

payload.email.messageCenter.id	Specifies an active message center in the application. customer departmentalization setting is enabled, the message center must be in the same department as the customer.
subject	Must not exceed 255 characters.
attachments	If attachments are provided, file type of any attachment must not be blocked in the application. This element is not allowed for multipart/form-data requests. To send attachments for multipart/form-data requests, refer Example 6 - Create a secure email response with all attributes, using Multipart/form-data content-type .
customAttributes	Name must match one of the custom attributes configured in application. If the custom attribute is configured as an enumeration, the value must be one of the predefined values.
payload.email.contents	Supported content types are "text" and "html". One or both can be provided.
payload.email.emailAddresses.replyTo	If present, any replies for this email will be sent to this email address. Must be a single email address in the valid email address format. Must not exceed 255 characters. Refer email address definition.
issueType.id	ID of the issue type of the activity. This can be provided only when payload.email.messageCenter.id is provided. The issue type must be associated with the message center specified through payload.email.messageCenter.id.

Size restrictions

- The email size (includes email content and attachments) cannot be more than the value of the partition setting "Maximum email size for retriever (MB)".
- The email content size cannot be more than the value of the partition setting "Maximum body size for retriever (KB)".

Note on department of the activity

The department of the activity will be determined as below:

- If none of payload.email.emailAddresses.receiver and payload.email.messageCenter.id are provided, the department of the activity will be based on the activity being responded.

- If payload.email.emailAddresses.receiver is provided, the department of the activity will be derived based on the value of payload.email.emailAddresses.receiver.
- If payload.email.messageCenter.id is provided, the department of the activity will be derived based on the value of payload.email.messageCenter.id.

attachments Element

Each attachment must be present within a separate *attachment* element. It must have the following representation:

Elements required for *attachment*

Name	Description
contentType	content type of the attachment content. Must not exceed 255 characters.
content	content of the attachment in base64 encoded format. Refer Size restrictions section for allowed content size.

Optional elements allowed for attachment

Name	Description
isInline	Flag to indicate if this is an inline attachment or not. Must be set to true for inline attachments.
contentId	This represents the identifier for the attachment. This is required only for inline attachments.
fileName	Name of the attachment file. Must not exceed 255 characters.

Supported API specific query parameters

The below API specific parameters are supported:

- customer={ID}: This is an optional parameter. If this parameter is provided:
 - The activity will be created for the customer specified through this query parameter. If this parameter is not provided, the activity will be created for self (logged in customer).
 - The logged in customer must be authorized to perform this action on behalf of the customer specified through the "customer" query parameter. Refer [Customer grants](#) Customer grants for more information about authorization.
-

Supported common query parameters

None

Request body XML schemas:

- [Activity Schema](#)

Response

Response headers

Name	Description	Possible values
X-egain-session	Session ID of the current user session	N/A
Content-Type	Media type of response body	application/xml or application/json
Location	Location of the new created activity	N/A

Response body XML schemas:

- [Error](#) - used in case of error

HTTP status codes

Success Status codes

201 - Created

- The request was successfully executed

Failure Status codes

400 - Bad Request

- Any unsupported query parameter is sent in the request.
- Request body does not contain the required elements.
- An unsupported element is present in the request body.
- Elements provided do not adhere to the rules stated in the [Request](#) section.
- Request body is empty.
- Size restrictions are violated. Refer [Size restrictions](#) section for details.
- The logged in customer is not authorized to perform this action on behalf of the customer provided through the query parameter "customer".
- The "customer" query parameter is provided, and the application does not find any email address for the customer specified through the "customer" query parameter.

401 - Unauthorized

- X-egain-session request header is missing
- Session is invalid or expired

406 - Not Acceptable

- If invalid language header is provided.

500 - Internal server error

CreateEmailComposeActivityPage Class Reference

Detailed Description

Compose and Save Email Activity

Overview

This API can be used to compose and save an email activity. Only one outbound email activity can be created at a time.

If the setting "Enable secure messaging" is enabled, and the value of the setting "Types of emails agents are allowed to send" is "Only secure emails", the created activity will be a secure activity.

Since:

11.6

APIs

Method	URL	Description
POST	/ws/v12/interaction/activity	Compose and save email activity.

Authentication

Authentication is required. The client must be logged in to call this API. Each API request must contain X-again-session request header returned by Login API.

Permissions

All of the following are required:

- User must have 'Create activity' action.
- If "BCC" address is provided in request, the user must have "Edit BCC field" action.
- The activity must be created in either the user's home department, or a department in which the user is a foreign user.

Licenses

The logged in user must have the following licenses:

- ECE CIH Platform
- ECE Mail

Request

Request headers

Name	Description	Allowed values	Default value
X-egain-session	Session ID obtained from Login API response header	N/A	N/A
Content-Type	Media type sent by the client.	application/xml or application/json or multipart/form-data	N/A
Accept	Content type accepted by the client.	application/xml or application/json	N/A
Accept-Language	Language locale accepted by client (used for locale specific fields in resource representation and in error responses)	Supported 'Accept-Language' header codes	default system language

Request Body

The request body is mandatory. The request body can be in one of the below two formats:

- XML / JSON representing the activity.
 - The activity can contain non-inline attachments. Refer the [attachments Element](#) section for more details.
- Multipart form data.
 - The following two parts must be present:
 - 1. "data": This part must have the data representing the email activity. This can either be in XML format or JSON format.
 - 2. "data-type": This part identifies the data type of "data" part. It can have one of the two values - "application/json" or "application/xml".
 - Optionally there can be more parts that represent non-inline attachments of the activity. Each of these parts must contain following header:
 - 1. "Content-Disposition": This header must have a property by name "fileName", which indicates the file name of the attachment.
- NOTE : Inline attachments are not supported by this API.

Elements required in the request body

Name	Description
department.name	Name of the department in which the activity should be created.

type.value	Must be "email".
type.subtype.value	Must be "compose".
payload.email.emailAddresses.to	<p>Specifies the customer's email address. This must be a single email address. If "Customer departmentalization" setting is enabled, this API will try to find the customer in the department of the activity, otherwise it will try to find the customer across the application.</p> <p>If a customer with this email address does not exist:</p> <ul style="list-style-type: none"> • The details of the customer to be created must be provided using the <i>customer</i> element. This will be used to create a new customer in the application • The email address specified in "payload.email.emailAddresses.to" will be added as a contact for the newly created customer. • Refer to the description of the optional "customer" element for more details.
payload.email.emailAddresses.from	Specifies the email address of an active email alias in the application. The alias must be present in the specified department. be a single email address. This value will also be used as the reply-to email address.
subject or attachments or content	Must have at least one of subject, attachments, or content.

Optional elements allowed in the request body

Name	Description
case.id	If case.id is not provided, the application will create a new case for the activity. If provided, this case must exist in the system and the activity will be associated to the case.
priority	Must be a value between 1 and 7.
dueDate	Must be a future date. Refer supported date format here .
subject	Must not exceed 245 characters.
attachments	If attachments are provided, file type of any attachment must not be blocked in the application. This element is not allowed for multipart/form-data requests. To send attachments for multipart/form-data

	requests refer Example 4 - Compose an email for a new case with required elements, using Multipart/form-data as content-type .
customAttributes	Name must match one of the custom attributes configured in application. If the custom attribute is configured as an enumeration, the value must be one of the predefined values.
payload.email.contents	Supported content types are "text" and "html". One or both can be provided.
payload.email.emailAddresses.cc	All addresses must be in the valid email address format. Must not exceed 255 characters. Refer email address definition for the valid email address format.
payload.email.emailAddresses.bcc	All addresses must be in the valid email address format. Must not exceed 255 characters. Refer email address definition for the valid email address format.
customer	<p>This will be used to create a new customer only if a customer with the email address provided using "payload.email.emailAddresses.to" attribute does not exist in the application. Otherwise, this attribute is ignored. API does not allow specifying "department.name" attribute in the customer element. Instead, when creating a new customer, customer's department is determined as follows:</p> <ul style="list-style-type: none"> • If the "Customer departmentalization" setting is enabled, the customer will be created in the department of the activity. • If the "Customer departmentalization" setting is not enabled, the created customer will be shared across all departments <p>the "Customer creation" API for more details about the customer element.</p>

Size restrictions

- The email size cannot be more than the value of the partition setting "Maximum email size for dispatcher (MB)".
- The email content size cannot be more than the value of the partition setting "Maximum body size for dispatcher (KB)".

attachments Element

Each attachment must be present within a separate *attachment* element. It must have the following representation:

Elements required for *attachment*

Name	Description
contentType	content type of the attachment content. Must not exceed 255 characters.
content	content of the attachment in base64 encoded format. Refer Size restrictions section above for allowed content size.
fileName	Name of the attachment file. Must not exceed 255 characters.

Supported API specific query parameters

None

Supported common query parameters

None

Response

CreateEmailComposeSendActivityPage Class Reference

Detailed Description

Compose and send email activity

Overview

This API can be used to compose and send an email activity. Only one outbound email activity can be created and sent at a time.

If the setting "Enable secure messaging" is enabled, and the value of the setting "Types of emails agents are allowed to send" is "Only secure emails", the created activity will be a secure activity.

As part of completing this API request:

- All macros present in the subject and content of the email activity will be expanded.

Since:

11.6

APIs

Method	URL	Description
POST	/ws/v12/interaction/activity/send	Compose and send email activity.

Authentication

Authentication is required. The client must be logged in to call this API. Each API request must contain X-egain-session request header returned by Login API.

Permissions

All of the following are required:

- User must have 'Create activity' action.
- If "BCC" address is provided in request, the user must have "Edit BCC field" action.
- The activity must be created in either the user's home department, or a department in which the user is a foreign user.
- If one or more article type macros are present in the subject or content of the activity, the user must have 'View Folder' permission on the folder of these articles.
- If one or more usage link macros are present in the subject or content of the activity, the user must have 'Execute' permission on these usage links.

Licenses

The logged in user must have the following licenses:

- ECE CIH Platform
- ECE Mail
- ECE Data Adapter: If one or more usage link macros are present in the subject or content of the activity.

Request

Request headers

Name	Description	Allowed values	Default value
X-egain-session	Session ID obtained from Login API response header	N/A	N/A
Content-Type	Media type sent by the client.	application/xml or application/json or multipart/form-data	N/A
Accept	Content type accepted by the client.	application/xml or application/json	N/A
Accept-Language	Language locale accepted by client (used for locale specific fields in resource representation and in error responses)	Supported 'Accept-Language' header codes	default system language

Request Body

The request body is mandatory. The request body can be in one of the below two formats:

- XML / JSON representing the activity.
 - The activity can contain non-inline attachments. Refer the [attachments Element](#) section for more details.
- Multipart form data.
 - The following two parts must be present:
 - 1. "data": This part must have the data representing the email activity. This can either be in XML format or JSON format.
 - 2. "data-type": This part identifies the data type of "data" part. It can have one of the two values - "application/json" or "application/xml".
 -
 - Optionally there can be more parts that represent non-inline attachments of the activity. Each of these parts must contain following header:

- 1. "Content-Disposition": This header must have a property by name "fileName", which indicates the file name of the attachment.
- NOTE : Inline attachments are not supported by this API.

Elements required in the request body

Name	Description
department.name	Name of the department in which the activity should be created.
type.value	Must be "email".
type.subtype.value	Must be "compose".
payload.email.emailAddresses.to	Specifies the customer's email address. This must be a single email address. If "Customer departmentalization" setting is enabled, this API will try to find the customer in the department of the activity, otherwise it will try to find the customer across the application. If a customer with this email address does not exist: <ul style="list-style-type: none"> • The details of the customer to be created must be provided using the <i>customer</i> element. This will be used to create a new customer in the application • The email address specified in "payload.email.emailAddresses.to" will be added as a contact for the newly created customer. • Refer to the description of the optional "customer" element for more details.
payload.email.emailAddresses.from	Specifies the email address of an active email alias in the application. The alias must be present in the specified department.be a single email address. This value will also be used as the reply-to email address.
subject or attachments or content	Must have at least one of subject, attachments, or content.

Optional elements allowed in the request body

Name	Description
case.id	If case.id is not provided, the application will create a new case for the activity. If provided, this case must exist in the system and the activity will be associated to the case.
priority	Must be a value between 1 and 7.

dueDate	Must be a future date. Refer supported date format here .
subject	Must not exceed 245 characters.can contain macros in the format (two grave accents followed by the macro name): ``<macro_name>. Eg: ``activity_id
attachments	If attachments are provided, file type of any attachment must not be blocked in the application. This element is not allowed for multipart/form-data requests. To send attachments for multipart/form-data requests refer Example 4 - Compose an email for a new case with required elements, using Multipart/form-data as content-type .
customAttributes	Name must match one of the custom attributes configured in application. If the custom attribute is configured as an enumeration, the value must be one of the predefined values.
payload.email.contents	Supported content types are "text" and "html". One or both can be provided.can contain macros in the format (two grave accents followed by the macro name): ``<macro_name>. Eg: ``activity_id
payload.email.emailAddresses.cc	All addresses must be in the valid email address format. Must not exceed 255 characters. Refer email address definition for the valid email address format.
payload.email.emailAddresses.bcc	All addresses must be in the valid email address format. Must not exceed 255 characters. Refer email address definition for the valid email address format.
customer	This will be used to create a new customer only if a customer with the email address provided using "payload.email.emailAddresses.to" attribute does not exist in the application. Otherwise, this attribute is ignored.API does not allow specifying "department.name" attribute in the customer element. Instead, when creating a new customer, customer's department is determined as follows: <ul style="list-style-type: none"> • If the "Customer departmentalization" setting is enabled, the customer will be created in the department of the activity.

	<ul style="list-style-type: none"> If the "Customer departmentalization" setting is not enabled, the created customer will be shared across all departments <p>the "Customer creation" API for more details about the customer element.</p>
--	--

Size restrictions

- The email size cannot be more than the value of the partition setting "Maximum email size for dispatcher (MB)".
- The email content size cannot be more than the value of the partition setting "Maximum body size for dispatcher (KB)".

attachments Element

Each attachment must be present within a separate *attachment* element. It must have the following representation:

Elements required for *attachment*

Name	Description
contentType	content type of the attachment content. Must not exceed 255 characters.
content	content of the attachment in base64 encoded format. Refer Size restrictions section above for allowed content size.
fileName	Name of the attachment file. Must not exceed 255 characters.

Supported API specific query parameters

None

Supported common query parameters

None

Response

Response headers

Name	Description	Possible values
X-egain-session	Session ID of the current user session	N/A

CreateEmailComposeSendCompleteActivityPage Class Reference

Detailed Description

Compose and send-complete email activity

Overview

This API can be used to compose and send-complete an email activity. Only one outbound email activity can be created and send-completed at a time.

If the setting "Enable secure messaging" is enabled, and the value of the setting "Types of emails agents are allowed to send" is "Only secure emails", the created activity will be a secure activity.

As part of completing this API request:

- All macros present in the subject and content of the email activity will be expanded.

Since:

11.6

APIs

Method	URL	Description
POST	/ws/v12/interaction/activity/sendcomplete	Compose and send-complete email activity.

Authentication

Authentication is required. The client must be logged in to call this API. Each API request must contain X-egain-session request header returned by Login API.

Permissions

All of the following are required:

- User must have 'Create activity' action.
- If "BCC" address is provided in request, the user must have "Edit BCC field" action.
- The activity must be created in either the user's home department, or a department in which the user is a foreign user.
- If one or more article type macros are present in the subject or content of the activity, the user must have 'View Folder' permission on the folder of these articles.
- If one or more usage link macros are present in the subject or content of the activity, the user must have 'Execute' permission on these usage links.

Licenses

The logged in user must have the following licenses:

- ECE CIH Platform
- ECE Mail
- ECE Data Adapter: If one or more usage link macros are present in the subject or content of the activity.

Request

Request headers

Name	Description	Allowed values	Default value
X-egain-session	Session ID obtained from Login API response header	N/A	N/A
Content-Type	Media type sent by the client.	application/xml or application/json or multipart/form-data	N/A
Accept	Content type accepted by the client.	application/xml or application/json	N/A
Accept-Language	Language locale accepted by client (used for locale specific fields in resource representation and in error responses)	Supported 'Accept-Language' header codes	default system language

Request Body

The request body is mandatory. The request body can be in one of the below two formats:

- XML / JSON representing the activity.
 - The activity can contain non-inline attachments. Refer the [attachments Element](#) section for more details.
- Multipart form data.
 - The following two parts must be present:
 - 1. "data": This part must have the data representing the email activity. This can either be in XML format or JSON format.
 - 2. "data-type": This part identifies the data type of "data" part. It can have one of the two values - "application/json" or "application/xml".
 -
 - Optionally there can be more parts that represent non-inline attachments of the activity. Each of these parts must contain following header:

- 1. "Content-Disposition": This header must have a property by name "fileName", which indicates the file name of the attachment.
- NOTE : Inline attachments are not supported by this API.

Elements required in the request body

Name	Description
department.name	Name of the department in which the activity should be created.
type.value	Must be "email".
type.subtype.value	Must be "compose".
payload.email.emailAddresses.to	Specifies the customer's email address. This must be a single email address. If "Customer departmentalization" setting is enabled, this API will try to find the customer in the department of the activity, otherwise it will try to find the customer across the application. If a customer with this email address does not exist: <ul style="list-style-type: none"> • The details of the customer to be created must be provided using the <i>customer</i> element. This will be used to create a new customer in the application • The email address specified in "payload.email.emailAddresses.to" will be added as a contact for the newly created customer. • Refer to the description of the optional "customer" element for more details.
payload.email.emailAddresses.from	Specifies the email address of an active email alias in the application. The alias must be present in the specified department.be a single email address. This value will also be used as the reply-to email address.
subject or attachments or content	Must have at least one of subject, attachments, or content.

Optional elements allowed in the request body

Name	Description
case.id	If case.id is not provided, the application will create a new case for the activity. If provided, this case must exist in the system and the activity will be associated to the case.
priority	Must be a value between 1 and 7.

dueDate	Must be a future date. Refer supported date format here .
subject	Must not exceed 245 characters.can contain macros in the format (two grave accents followed by the macro name): ``<macro_name>. Eg: ``activity_id
attachments	If attachments are provided, file type of any attachment must not be blocked in the application. This element is not allowed for multipart/form-data requests. To send attachments for multipart/form-data requests refer Example 4 - Compose an email for a new case with required elements, using Multipart/form-data as content-type .
customAttributes	Name must match one of the custom attributes configured in application. If the custom attribute is configured as an enumeration, the value must be one of the predefined values.
payload.email.contents	Supported content types are "text" and "html". One or both can be provided.can contain macros in the format (two grave accents followed by the macro name): ``<macro_name>. Eg: ``activity_id
payload.email.emailAddresses.cc	All addresses must be in the valid email address format. Must not exceed 255 characters. Refer email address definition for the valid email address format.
payload.email.emailAddresses.bcc	All addresses must be in the valid email address format. Must not exceed 255 characters. Refer email address definition for the valid email address format.
customer	This will be used to create a new customer only if a customer with the email address provided using "payload.email.emailAddresses.to" attribute does not exist in the application. Otherwise, this attribute is ignored.API does not allow specifying "department.name" attribute in the customer element. Instead, when creating a new customer, customer's department is determined as follows: <ul style="list-style-type: none"> • If the "Customer departmentalization" setting is enabled, the customer will be created in the department of the activity.

	<ul style="list-style-type: none"> If the "Customer departmentalization" setting is not enabled, the created customer will be shared across all departments <p>the "Customer creation" API for more details about the customer element.</p>
--	--

Size restrictions

- The email size cannot be more than the value of the partition setting "Maximum email size for dispatcher (MB)".
- The email content size cannot be more than the value of the partition setting "Maximum body size for dispatcher (KB)".

attachments Element

Each attachment must be present within a separate *attachment* element. It must have the following representation:

Elements required for *attachment*

Name	Description
contentType	content type of the attachment content. Must not exceed 255 characters.
content	content of the attachment in base64 encoded format. Refer Size restrictions section above for allowed content size.
fileName	Name of the attachment file. Must not exceed 255 characters.

Supported API specific query parameters

None

Supported common query parameters

None

Response

Response headers

Name	Description	Possible values

CreateEmailInboundActivityPage Class Reference

Detailed Description

Create Incoming Email Activity

Overview

This API can be used to create a new incoming email activity. Only one email activity can be created at a time.

Since

14.0.3

APIs

Method	URL	Description
POST	/ws/v12/interaction/activity	Create incoming email activity.

Authentication

Authentication is required. The client must be logged in to call this API. Each API request must contain X-egain-session request header returned by Login API.

Permissions

All of the following are required:

- The user must have administer partition permission.

Licenses

The following licenses must be installed:

- ECE CIH Platform
- ECE Mail

Request

Request headers

Name	Description	Allowed values	Default value
X-egain-session	Session ID obtained from Login API	N/A	N/A

	response header		
Content-Type	Media type sent by the client.	application/xml or application/json or multipart/form-data	N/A
Accept	Content type accepted by the client.	application/xml or application/json	N/A
Accept-Language	Language locale accepted by client (used for locale specific fields in resource representation and in error responses)	Supported 'Accept-Language' header codes	default system language

Request Body

The request body is mandatory. The request body can be in one of the below two formats:

- XML / JSON representing the activity.
 - The activity can contain attachments which can be either inline or non-inline. Refer the [attachments Element](#) section for more details.
- Multipart form data.
 - The following two parts must be present:
 - . "data": This part must have the data representing the email activity. This can either be in XML format or JSON format.
 - . "data-type": This part identifies the data type of "data" part. It can have one of the two values - "application/json" or "application/xml".
 -
 - Optionally there can be more parts that represent attachments of the activity. Each of these parts must contain one of the following headers:
 - . "Content-ID": Presence of Content-ID header implies that this is an inline attachment and the header contains the identifier for the attachment. This may additionally have a header by name "Content-Disposition", with "fileName" as a property.
 - a) The value of Content-ID must be enclosed within angular brackets (between '<' and '>'). For example, Content-ID: <[image001.png@01D088BF.E1D8D780](#)>.
 - . "Content-Disposition": "Content-Disposition" implies that this is a non-inline attachment. This must have a property by name "fileName" - This property contains the file name of the attachment. : If both Content-ID and Content-Disposition headers are present, the attachment will be treated as an inline attachment.

Note about inline attachments:

Inline attachments are supported using the [cid URL scheme](#). The cid URL scheme allows references to attachments from the email content. Refer [Example 3 - Create an inbound email with inline and non-inline attachments, using XML/JSON as content-type](#) and [Example 4 - Create inbound email with inline and non-inline attachments, using Multipart/form-data as](#)

[content-type](#) for details.

Elements required in the request body

Name	Description
department.name	Name of the department in which the activity should be created.
type.value	Must be "email".
type.subtype.value	Must be "general".
payload.email.emailAddresses.from	<p>Specifies the customer's email address. This must be a single email address. If "Customer departmentalization" setting is enabled, this API will try to find the customer in the department of the activity, otherwise it will try to find the customer across the application.</p> <p>If a customer with this email address does not exist:</p> <ul style="list-style-type: none"> • The details of the customer to be created must be provided using the <i>customer</i> element. This will be used to create a new customer in the application • The email address specified in "payload.email.emailAddresses.from" will be added as a contact for the newly created customer. • Refer to the description of the optional "customer" element for more details.
payload.email.emailAddresses.receiver	Specifies the email address of an active email alias in application. The email activity is associated with this email alias. It must be a single email address. This email address must match an active alias in the specified department.
payload.email.date	Date when email was sent. Refer supported date format here .
subject or attachments or content	Must have atleast one of subject, attachments or content.

Optional elements allowed in the request body

Name	Description
case.id	If case.id is not provided, the application will create a new case for the activity. If provided, this case must exist in the system and the activity will be associated with the case.
isSecure	Flag to indicate whether the activity is a

	secure activity or not. Must be "true" or "false". If "true", the created activity will be a secure email. Default value is "false". If "Enable secure messaging" setting is disabled in the application, the customer cannot create a secure email and will receive 400 error response code.
subject	Must not exceed 255 characters.
attachments	If attachments are provided, file type of any attachment must not be blocked in the application. This element is not allowed for multipart/form-data requests. To send attachments for multipart/form-data requests, refer Example 6 - Create an inbound email by specifying all attributes, using Multipart/form-data as content-type.
customAttributes	Name must match one of the custom attributes configured in application. If the custom attribute is configured as an enumeration, the value must be one of the predefined values.
payload.email.contents	Supported content types are "text" and "html". One or both can be provided.
payload.email.emailAddresses.to	All addresses must be in the valid email address format. Must not exceed 255 characters. Refer email address definition for the valid email address format.
payload.email.emailAddresses.cc	All addresses must be in the valid email address format. Must not exceed 255 characters. Refer email address definition for the valid email address format.
payload.email.emailAddresses.replyTo	If present, any replies for this email will be sent to this email address. Must be a single email address in the valid email address format. Must not exceed 255 characters. Refer email address definition.
customer	This will be used to create a new customer only if a customer with the email address provided using "payload.email.emailAddresses.from" attribute does not exist in the application. Otherwise, this attribute is ignored. API does not allow specifying "department.name" attribute in the customer element. Instead, when creating a new customer, customer's department is

	<p>determined as follows:</p> <ul style="list-style-type: none"> • If the "Customer departmentalization" setting is enabled, the customer will be created in the department of the activity. • If the "Customer departmentalization" setting is not enabled, the created customer will be shared across all departments <p>the "Customer creation" API for more details about the customer element.</p>
--	---

Size restrictions

- The email size (includes email content and attachments) cannot be more than the value of the partition setting "Maximum email size for retriever (MB)".
- The email content size cannot be more than the value of the partition setting "Maximum body size for retriever (KB)".

attachments Element

Each attachment must be present within a separate *attachment* element. It must have the following representation:

Elements required for *attachment*

Name	Description
contentType	content type of the attachment content. Must not exceed 255 characters.
content	content of the attachment in base64 encoded format. Refer Size restrictions section for allowed content size.

Optional elements allowed for attachment

Name	Description
isInline	Flag to indicate if this is an inline attachment or not. Must be set to true for inline attachments.
contentId	This represents the identifier for the attachment. This is required only for inline attachments.
fileName	Name of the attachment file. Must not exceed 255 characters.

Supported API specific query parameters

None

Supported common query parameters

None

Response

Response headers

CreateEmailInboundExamples Class Reference

Detailed Description

Examples for Create Incoming Email Activity

Example 1 - Create secure email for an existing case with required elements, using XML/JSON as content-type

Using XML/JSON as the content-type, this example demonstrates the following:

- Creating an email for an existing case
- Creating an email with required elements, subject and content
- Creating a secure email for an existing case. Note that to create a secure email, isSecure attribute with a value of "true" is set in the activity representation.

XML

Request

Method	URL
POST	/ws/v12/interaction/activity

```

Response:

HTTP/1.1 201 Created

Response headers

Name	Value
X-egain-session	current session ID
Content-Type	application/json
Location	/system/ws/v12/interaction/activity/2795

Example 2 - Create email for a new case with required elements, using Multipart/form-data as content-type

Using multipart/form-data as the content type, this example demonstrates the following:

- Creating an inbound email for a new case

- Creating an inbound email using required elements, subject and content

This uses multipart/form-data representation for the request data.

Note that the value of "isSecure" attribute is sent as "false" in the request. The API would work the same if this attribute was left out as well, since the default value for "isSecure" is "false".

Example 3 - Create an inbound email with inline and non-inline attachments, using XML/JSON as content-type

Using XML/JSON as content-type, this example demonstrates the following:

- Creating a new inbound email for a new case
- Creating inbound email using required elements, subject and content
- Using non-inline attachment as part of the email
- Using inline attachment as part of the email

Note:

. isInline element is not present for the attachment with fileName laptop_issue.gif. Hence, this attachment will be treated as a non-inline attachment.

. isInline element is set to true for the attachment with contentId 14A6D171E20D4FD8A20D0D17B6C984CF@example.com. This attachment is being referred by the image in the email content using the [cid URL scheme](#). Hence, this attachment will be treated as an inline attachment for this email.

Example 4 - Create inbound email with inline and non-inline attachments, using Multipart/form-data as content-type

Using Multipart/form-data, this example the following:

- Creating an inbound email for a new case
- Creating an email with required elements, subject and content
- Using inline attachment in the email
- Using non-inline attachment in the email

Note:

. The 3rd body part has the Content-ID header with value 06FE0B5C60B94D0FA57450C77A18AB33@example.com. This body part is being referred by the image in the "data" part using the [cid URL scheme](#). Hence, the 3rd body part will be treated as an inline attachment for this email.

. Content-ID header is not present in the 4th body part. Hence, this part will be treated as a non-inline attachment.

Example 5 - Create a secure inbound email by specifying all attributes, using XML/JSON as content-type

Using XML/JSON as content-type, this example demonstrates the following:

- Creating an inbound email for an existing case.
- Creating a secure email using all supported elements (required and optional).
- Customer representation in the request. If the customer with the email address specified in from email address does not exist, this will be used for creating a new Customer for the email.

Response:

HTTP/1.1 201 Created

Response headers

Name	Value
X-egain-session	current session ID
Content-Type	application/json
Location	/system/ws/v12/interaction/activity/2795

Example 6 - Create an inbound email by specifying all attributes, using Multipart/form-data as content-type

Using multipart/form-data as content-type, this example demonstrates the following:

- Creating an inbound email for a new case.
- Creating an email using all supported elements (required and optional).
- Customer representation in the request. If the customer with the email address specified in from email address does not exist, this will be used for creating a new Customer for the email.

CreateGroupCustomerExamples Class Reference

Detailed Description

Examples for Create Group Customer

Example 1 - Create customer with required elements

This example demonstrates the following:

- Creating a group customer by providing only the required elements
- This example assumes that the "Customer departmentalization" setting is disabled, and hence, department is not a required attribute.

XML

Request

Method	URL
POST	/ws/v12/interaction/customer

Request headers

Content-Type	application/xml
Accept-Language	en-US

Request body

```
<?xml version="1.0" encoding="UTF-8" standalone="yes"?><customer
xmlns="http://bindings.egain.com/ws/model/v12/gen/interaction/customer"
xmlns:ns2="http://bindings.egain.com/ws/model/v12/gen/platform"
xmlns:ns3="http://bindings.egain.com/ws/model/v12/gen/common">
  <value>group</value>
  <ns3:value>Association</ns3:value>
  <customerName>Unichem Laboratories Limited</customerName></customer>
```

Response

HTTP/1.1 201 Created

Response headers

Name	Value
X-egain-session	current session ID
Content-Type	application/xml
Location	/system/ws/v12/interaction/customer/2805

JSON

Request

Method	URL
POST	/ws/v12/interaction/customer

Request headers

Name	Value
X-egain-session	Valid session ID
Accept	application/json
Content-Type	application/json
Accept-Language	en-US

Request body

```
{  "type": {    "value": "group",    "group": {      "type": {        "value": "Association"      }    },    "customerName": "Unichem Laboratories Limited"  }
```

Response

HTTP/1.1 201 Created

Response headers

Name	Value
X-egain-session	current session ID
Content-Type	application/json
Location	/system/ws/v12/interaction/customer/2806

Example 2 - Create customer with all elements

This example demonstrates the following:

- Creating a group customer with all elements
- Creating contact point of all types.
- This example assumes that the "Customer departmentalization" setting is enabled, and hence, this example also shows the representation of department in the request.

CreateGroupCustomerPage Class Reference

Detailed Description

Create Group Customer

Overview

This API allows user to create a group customer. A group customer can have multiple Contact Persons, and the Contact Person may have one or more Contact Points.

Only one customer can be created at a time.

Since:

11.6

APIs

Method	URL	Description
POST	/ws/v12/interaction/customer	Create group customer.

Authentication

Authentication is required. The client must be logged in to call this API. Each API request must contain X-egain-session request header returned by Login API.

Permissions

All of the following are required:

- User should have 'Create Customer' action.
- If "Customer departmentalization" setting is enabled in the application, then created customer must belong to either the user's home department, or to the department where the user is a foreign user.

Licenses

The logged in user must have the following licenses:

- ECE CIH Platform

Request

Request headers

Name	Description	Allowed values	Default value
X-egain-session	Session ID obtained	N/A	N/A

	from Login API response header		
Accept	Content type accepted by client.	application/xml or application/json	N/A
Content-Type	Media type sent by the client	application/xml or application/json	N/A
Accept-Language	Language locale accepted by client (used for locale specific fields in resource representation and in error responses)	Supported 'Accept-Language' header codes	default system language

Request Body

The request body is mandatory. Request body can be in either XML or JSON format:

Elements required in request body

Name	Description
department.name	Name of the department in which the customer should be created. Department name is required only If "Customer departmentalization" setting is enabled in the application.
type.value	Must be "group".
customerName	Must not exceed 124 characters.
type.group.type.value	Must be one of the values configured in application.

Optional elements allowed in request body

Name	Description
level	Must be one of the values configured in application.
role	Must be one of 'Partner', 'Reseller', or 'Customer'.
Pin	Must not exceed 255 characters.
howReferred	Must be one of 'Website', 'Customer', 'Partner', 'Employee', or 'Reseller'.
industry	Must be one of the values configured in application.

marketSegment	Must not exceed 50 characters.
entitlements	Must not exceed 1024 characters.
customAttributes	Name must match one of the custom attributes configured in application. If the custom attribute is configured as an enumeration, the value must be one of the predefined values.
contactPersons.contactPerson	One or more contact persons can be provided. For required and optional elements of contact person, refer Create Contact Person .
type.group.region	Must be one of the values configured in application.
type.group.numberOfMembers	Must not exceed 19 digits.
type.group.income	Must not exceed 20 characters.
type.group.currency	Must not exceed 255 characters.
type.group.registrationNumber	Must not exceed 255 characters.
type.group.affiliation	Must not exceed 50 characters.

Request body XML schemas:

- [Customers Schema](#)

Supported API specific query parameters

None

Supported common query parameters

None

Response

Response headers

Name	Description	Possible values
X-egain-session	Session ID of the current user session	N/A
Content-Type	Media type of response body	application/xml or application/json
Location	Location of the new created customer	N/A

Response body XML schemas:

- [Error](#) - used in case of error

HTTP status codes

Success Status codes

201 - Created

- The request was successfully executed.

Failure Status codes

400 - Bad Request

- Any query parameter is sent in the request.
- Request body does not contain the required elements.
- An unsupported element is present in the request body.
- Elements provided do not adhere to the rules stated in the [Request Body](#) section.
- Request body is empty.

401 - Unauthorized

- X-egain-session request header is missing.
- Session is invalid or expired.

403 - Forbidden

- The user does not have sufficient permissions. Refer [Permissions](#) section for details.

500 - Internal server error

Examples:

[Example 2 - Create customer with all elements](#)

CreateIncomingEmailActivityPage Class Reference

Detailed Description

Create Incoming Email Activity

Overview

This API can be used by customers to create a new secure inbound email activity. Only one activity can be created at a time.

Since

15.0.2

APIs

Method	URL	Description
POST	/ws/v15/context/interaction/activity	Create incoming email activity.

Authentication

Authentication is required. The customer must be logged in to call this API. Each API request must contain X-egain-session request header returned by Login API.

Permissions

- All authenticated customers can access this API.
- If the query parameter customer={ID} is provided, the logged in customer must be authorized to perform this action on behalf of the customer specified through the "customer" query parameter. Otherwise, the application will return a 400 (bad request). Refer [Customer grants](#) Customer grants for more information about authorization.

Request

Request headers

Name	Description	Allowed values	Default value
X-egain-session	Session ID obtained from Login API response header	N/A	N/A
Content-Type	Media type sent by the client.	application/xml or	N/A

		application/json or multipart/form-data	
Accept	Content type accepted by the client.	application/xml or application/json	N/A
Accept-Language	Language locale accepted by client (used for locale specific fields in resource representation and in error responses)	Supported 'Accept-Language' header codes	default system language

Request Body

The request body is mandatory. The request body can be in one of the below two formats:

- XML / JSON representing the activity.
 - The activity can contain attachments which can be either inline or non-inline. Refer the [attachments Element](#) section for more details.
- Multipart form data.
 - The following two parts must be present:
 - . "data": This part must have the data representing the email activity. This can either be in XML format or JSON format.
 - . "data-type": This part identifies the data type of "data" part. It can have one of the two values - "application/json" or "application/xml".
 - Optionally there can be more parts that represent attachments of the activity. Each of these parts must contain one of the following headers:
 - . "Content-ID": Presence of Content-ID header implies that this is an inline attachment and the header contains the identifier for the attachment. This may additionally have a header by name "Content-Disposition", with "fileName" as a property.
 - a) The value of Content-ID must be enclosed within angular brackets (between '<' and '>'). For example, Content-ID: <image001.png@01D088BF.E1D8D780>.
 - . "Content-Disposition": "Content-Disposition" implies that this is a non-inline attachment. This must have a property by name "fileName" - This property contains the file name of the attachment. : If both Content-ID and Content-Disposition headers are present, the attachment will be treated as an inline attachment.

Note about inline attachments:

Inline attachments are supported using the [cid URL scheme](#). The cid URL scheme allows references to attachments from the email content. Refer [Example 3 - Create a secure email with inline and non-inline attachments, using XML/JSON content-type](#) and [Example 4 - Create a secure email with inline and non-inline attachment, using Multipart/form-data content-type](#) for details.

Elements required in the request body

Name	Description
type.value	Must be "email".
type.subtype.value	Must be "general".
payload.email.emailAddresses.receiver or payload.email.messageCenter.id	One of payload.email.emailAddresses.receiver or payload.email.messageCenter.id must be provided. The department of the activity will be derived based on the value of payload.email.emailAddresses.receiver or payload.email.messageCenter.id.
subject or attachments or content	Must have atleast one of subject, attachments or content.

Optional elements allowed in the request body

Name	Description
payload.email.emailAddresses.from	Specifies the sender's email address. this attribute is not provided, the application will automatically figure out the email address to use for the activity. provided, must be a single email address. <ol style="list-style-type: none">1. If the query parameter "customer" is not provided:<ul style="list-style-type: none">• If this email address is present in the application, it must be associated with the logged in contact. If the email address is not present in the application, a new contact point with the provided email address will be created and used for activity creation.• If "Customer departmentalization" setting is enabled in the application, this email address will be looked up in the department of the customer.2. If the query parameter "customer" is provided, this attribute ("payload.email.emailAddresses.from") must not be provided. The application will automatically figure out the email address to use for the activity, since the activity is being created for a different customer.<ul style="list-style-type: none">• If the application does not find any email addresses for the customer provided through "customer" query parameter, the application will error out. It will not create a new email address for the customer

payload.email.emailAddresses.receiver	Specifies the email address of an active email alias in application. The email activity is associated with this email alias. customer departmentalization setting is enabled, the alias must be in the same department as the customer. Must be a single email address.
payload.email.messageCenter.id	Specifies an active message center in the application. customer departmentalization setting is enabled, the message center must be in the same department as the customer.
case.id	If case.id is not provided, the application will create a new case for the activity. If provided, this case must exist in the system and the activity will be associated with the case.
subject	Must not exceed 255 characters.
attachments	If attachments are provided, file type of any attachment must not be blocked in the application. This element is not allowed for multipart/form-data requests. To send attachments for multipart/form-data requests, refer Example 6 - Create a secure email with all attributes, using Multipart/form-data content-type .
customAttributes	Name must match one of the custom attributes configured in application. If the custom attribute is configured as an enumeration, the value must be one of the predefined values.
payload.email.date	Date when email was created. Refer supported date format here . If not provided, the server date will be used.
payload.email.contents	Supported content types are "text" and "html". One or both can be provided.
payload.email.emailAddresses.replyTo	If present, any replies for this email will be sent to this email address. Must be a single email address in the valid email address format. Must not exceed 255 characters. Refer email address definition.
issueType.id	ID of the issue type of the activity. This can be provided only when payload.email.messageCenter.id is provided. The issue type must be associated with the message center

	specified through payload.email.messageCenter.id.
--	--

Size restrictions

- The email size (includes email content and attachments) cannot be more than the value of the partition setting "Maximum email size for retriever (MB)".
- The email content size cannot be more than the value of the partition setting "Maximum body size for retriever (KB)".

attachments Element

Each attachment must be present within a separate *attachment* element. It must have the following representation:

Elements required for *attachment*

Name	Description
contentType	content type of the attachment content. Must not exceed 255 characters.
content	content of the attachment in base64 encoded format. Refer Size restrictions section for allowed content size.

Optional elements allowed for attachment

Name	Description
isInline	Flag to indicate if this is an inline attachment or not. Must be set to true for inline attachments.
contentId	This represents the identifier for the attachment. This is required only for inline attachments.
fileName	Name of the attachment file. Must not exceed 255 characters.

Supported API specific query parameters

The below API specific parameters are supported:

- customer={ID}: This is an optional parameter. If this parameter is provided:
 - The activity will be created for the customer specified through this query parameter. If this parameter is not provided, the activity will be created for self (logged in customer).
 - The logged in customer must be authorized to perform this action on behalf of the customer specified through the "customer" query parameter. Refer [Customer grants](#) Customer grants for more information about authorization.
-

Supported common query parameters

None

Request body XML schemas:

- [Activity Schema](#)

Response

Response headers

Name	Description	Possible values
X-egain-session	Session ID of the current user session	N/A
Content-Type	Media type of response body	application/xml or application/json
Location	Location of the new created activity	N/A

Response body XML schemas:

- [Error](#) - used in case of error

HTTP status codes

Success Status codes

201 - Created

- The request was successfully executed

Failure Status codes

400 - Bad Request

- Any unsupported query parameter is sent in the request.
- Request body does not contain the required elements.
- An unsupported element is present in the request body.
- Elements provided do not adhere to the rules stated in the [Request](#) section.
- Request body is empty.
- Size restrictions are violated. Refer [Size restrictions](#) section for details.
- The logged in customer is not authorized to perform this action on behalf of the customer provided through the query parameter "customer".
- The "customer" query parameter is provided, and the application does not find any email address for the customer specified through the "customer" query parameter.

401 - Unauthorized

- X-egain-session request header is missing
- Session is invalid or expired

406 - Not Acceptable

- If invalid language header is provided.

500 - Internal server error

Examples:

[Example 1 - Create a secure email for an existing case with required elements, using XML/JSON content-type](#)

[Example 2 - Create a secure email for a new case with required elements, using Multipart/form-data content-type](#)

[Example 3 - Create a secure email with inline and non-inline attachments, using XML/JSON content-type](#)

[Example 4 - Create a secure email with inline and non-inline attachment, using Multipart/form-data content-type](#)

[Example 5 - Create a secure email with all attributes, using XML/JSON content-type](#)

[Example 6 - Create a secure email with all attributes, using Multipart/form-data content-type](#)

[Example 7 - Create secure email with required elements for another customer, using XML/JSON content-type](#)

[Example 8 - Create secure email for another customer with required elements, using Multipart/form-data content-type](#)

[Example 9 - Create secure email by providing receiver email address, using XML/JSON content-type](#)

[**Example 10 - Create secure email by providing receiver email address, using Multipart/form-data content-type**](#)

CreateIncomingEmailExamples Class Reference

Detailed Description

Examples for Create Incoming Email Activity

Example 1 - Create a secure email for an existing case with required elements, using XML/JSON content-type

Using XML/JSON as the content-type, this example demonstrates the following:

- Creating a secure email for an existing case.
- Creating an email with required elements, message center ID, subject and content.

XML

Request

Method	URL
POST	/ws/v15/context/interaction/activity

            "value": "This is the issue"
          },
          {
            "type": "html",
            "value": "<HTML><HEAD><TITLE></TITLE></HEAD><BODY><P>This is the issue <BR> </P></BODY></HTML>"
          }
        ],
        "messageCenter": {
          "id": "Service"
        }
      }
    }
  }
}
```

Response:

HTTP/1.1 201 Created

Response headers

Name	Value
X-egain-session	current session ID
Content-Type	application/json
Location	/system/ws/v15/context/interaction/activity/2795

Example 2 - Create a secure email for a new case with required elements, using Multipart/form-data content-type

Using "multipart/form-data" as the content-type, this example demonstrates the following:

- Creating an email for a new case.
- Creating an email with required elements, message center ID, subject and content.

XML

Request

Method	URL
POST	/ws/v15/context/interaction/activity

Request headers :

Name	Value
X-egain-session	Valid session ID
Content-Type	multipart/form-data; boundary=----WebKitFormBoundaryLyRAYGiE5mFu3Ucv
Accept	application/xml
Accept-Language	en-US

Request body:

```

Location	/system/ws/v15/context/interaction/activity /2800

Example 3 - Create a secure email with inline and non-inline attachments, using XML/JSON content-type

Using XML/JSON as the content-type, this example demonstrates the following:

- Creating an email for a new case
- Creating an email with required elements, message center ID, subject and content
- Representation of non-inline attachments in the request
- Representation of inline attachments in the request
- Creating an email with inline and non-inline attachments.

Note:

. isInline element is not present for the attachment with fileName laptop_issue.gif. Hence, this attachment will be treated as a non-inline attachment.

. isInline element is set to true for the attachment with contentId 14A6D171E20D4FD8A20D0D17B6C984CF@example.com. This attachment is being referred by the image in the email

content using the [cid URL scheme](#). Hence, this attachment will be treated as an inline attachment for this email.

XML

Request

Example 4 - Create a secure email with inline and non-inline attachment, using Multipart/form-data content-type

Using Multipart/form-data as content-type, this example demonstrates the following:

- Creating an email for a new case
- Creating an email with required elements, message center ID, subject and content
- Representation of inline attachment in the request
- Representation of non-inline attachment in the request
- Creating an email with inline and non-inline attachments

Note:

. The 3rd body part has the Content-ID header with value 06FE0B5C60B94D0FA57450C77A18AB33@example.com. This body part is being referred by the image in the "data" part using the [cid URL scheme](#). Hence, the 3rd body part will be treated as an inline attachment for this email.

. Content-ID header is not present in the 4th body part. Hence, this part will be treated as a non-inline attachment.

CreateIndividualCustomerExamples Class Reference

Detailed Description

Examples for Create Individual Customer

Example 1 - Create customer with required elements

This example demonstrates the following:

- Creating an individual customer by providing only the required elements.
- This example assumes that the "Customer departmentalization" setting is disabled, and hence, department is not a required attribute.

XML

Request

Method	URL
POST	/ws/v12/interaction/customer

Request headers

Name	Value
X-egain-session	Valid session ID
Accept	application/xml
Content-Type	application/xml
Accept-Language	en-US

Request body

```
<customer xmlns="http://bindings.egain.com/ws/model/v12/gen/interaction/customer"
  xmlns:ns1="http://bindings.egain.com/ws/model/v12/gen/interaction/contactperson"
  xmlns:ns2="http://bindings.egain.com/ws/model/v12/gen/platform" > <type>
<value>individual</value> </type> <contactPersons> <ns1:contactPerson>
  <ns1:firstName>Jack</ns1:firstName> </ns1:contactPerson>
</contactPersons></customer>
```

Response

HTTP/1.1 201 Created

Response headers

Name	Value
X-egain-session	current session ID
Content-Type	application/xml
Location	/system/ws/v12/interaction/customer/2801

JSON

Request

Method	URL
POST	/ws/v12/interaction/customer

Request headers

Name	Value
X-egain-session	Valid session ID
Accept	application/json
Content-Type	application/json
Accept-Language	en-US

Request body

```
{  "type": {    "value": "individual"  },  "contactPersons": {    "contactPerson": [    {      "firstName": "Jack"    }    ]  } }
```

Response

HTTP/1.1 201 Created

Response headers

Name	Value
X-egain-session	current session ID
Content-Type	application/json
Location	/system/ws/v12/interaction/customer/2802

Example 2 - Create customer with all elements

This example demonstrates the following:

- Creating a individual customer with all elements
- Creating contact point of all types.
- This example assumes that the "Customer departmentalization" setting is enabled, and hence, this example also shows the representation of department in the request.

XML

Request

Method	URL
POST	/ws/v12/interaction/customer

Request headers

CreateIndividualCustomerPage Class Reference

Detailed Description

Create Individual Customer

Overview

This API allows user to create an individual customer. An individual customer can have only one Contact Person, and the Contact Person may have one or more Contact Points.

Only one customer can be created at a time.

Since:

11.6

APIs

Method	URL	Description
POST	/ws/v12/interaction/customer	Create individual customer.

Authentication

Authentication is required. The client must be logged in to call this API. Each API request must contain X-egain-session request header returned by Login API.

Permissions

All of the following are required:

- User must have 'Create Customer' action.
- If "Customer departmentalization" setting is enabled in the application, then created customer must belong to either the user's home department, or to the department where the user is a foreign user.

Licenses

The logged in user must have the following licenses:

- ECE CIH Platform

Request

Request headers

Name	Description	Allowed values	Default value
X-egain-session	Session ID obtained	N/A	N/A

	from Login API response header		
Accept	Content type accepted by client.	application/xml or application/json	N/A
Content-Type	Media type sent by the client	application/xml or application/json	N/A
Accept-Language	Language locale accepted by client (used for locale specific fields in resource representation and in error responses)	Supported 'Accept-Language' header codes	default system language

Request Body

The request body is mandatory. Request body can be in either XML or JSON format:

Elements required in request body

Name	Description
department.name	Name of the department in which the customer should be created. Department name is required only If "Customer departmentalization" setting is enabled in the application.
type.value	Must be "individual".
contactPersons.contactPerson	Only one contact person can be created for an individual customer. For required and optional elements of contact person, refer Create Contact Person .

Optional elements allowed in request body

Name	Description
level	Must be one of the values configured in application.
role	Must be one of 'Partner', 'Reseller', or 'Customer'.
Pin	Must not exceed 255 characters.
howReferred	Must be one of 'Website', 'Customer', 'Partner', 'Employee', or 'Reseller'.
industry	Must match the value configured in

	application.
marketSegment	Must not exceed 50 characters.
entitlements	Must not exceed 1024 characters.
customAttributes	Name must match one of the custom attributes configured in application. If the custom attribute is configured as an enumeration, the value must be one of the predefined values.

Request body XML schemas:

- [Customers Schema](#)

Supported API specific query parameters

None

Supported common query parameters

None

Response

Response headers

Name	Description	Possible values
X-egain-session	Session ID of the current user session	N/A
Content-Type	Media type of response body	application/xml or application/json
Location	Location of the new created customer	N/A

Response body XML schemas:

- [Error](#) - used in case of error

HTTP status codes

Success Status codes

201 - Created

- The request was successfully executed.

Failure Status codes

400 - Bad Request

- Any query parameter is sent in the request.
- Request body does not contain the required elements.
- An unsupported element is present in the request body.
- Elements provided do not adhere to the rules stated in the [Request Body](#) section.
- Request body is empty.

401 - Unauthorized

- X-again-session request header is missing.
- Session is invalid or expired.

403 - Forbidden

- The user does not have sufficient permissions. Refer [Permissions](#) section for details.

500 - Internal server error

Examples:

[Example 1 - Create customer with required elements](#)

[Example 2 - Create customer with all elements](#)

 - void [setPassword](#) (java.lang.String value)
-

Detailed Description

Credentials Schema

This schema contains [Credentials](#) type details.

XML Schema File

model/v12/xsd/kb/folder.xsd

Name	Description	Type
login	User name to login to machine of external location	String
password	Password for the above login	String

Member Function Documentation

java.lang.String [getLogin](#) ()

Gets the value of the login property.

Returns:

possible object is [java.lang.String](#)

java.lang.String [getPassword](#) ()

Gets the value of the password property.

Returns:

possible object is [java.lang.String](#)

void [setLogin](#) (java.lang.String value)

Sets the value of the login property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void [setPassword](#) (java.lang.String value)

Sets the value of the password property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

CustomAttributes Class Reference

-

Detailed Description

CustomAttributes Schema

This schema contains [CustomAttributes](#) definition.

XML Schema File

model/v12/xsd/common.xsd

Name	Description	Type
attribName	Name of the custom attribute	String
attribValues	Details about the values of this custom attribute	AttribValues

Member Function Documentation

java.lang.String [getAttribName](#) ()

Gets the value of the attribName property.

Returns:

possible object is [java.lang.String](#)

[AttribValues](#) [getAttribValues](#) ()

Gets the value of the attribValues property.

Returns:

possible object is [AttribValues](#)

void [setAttribName](#) (java.lang.String value)

Sets the value of the attribName property.

Parameters:

value	allowed object is java.lang.String
-------	--

void [setAttribValues](#) ([AttribValues](#) value)

Sets the value of the attribValues property.

Parameters:

<i>value</i>	allowed object is AttribValues
--------------	--

CustomAttributes Class Reference

-

Detailed Description

CustomAttributes Schema

This schema contains [CustomAttributes](#) definition.

XML Schema File

model/v15/xsd/common.xsd

Name	Description	Type
attribName	Name of the custom attribute	String
attribValues	Details about the values of this custom attribute	AttribValues

Member Function Documentation

java.lang.String [getAttribName](#) ()

Gets the value of the attribName property.

Returns:

possible object is [java.lang.String](#)

[AttribValues](#) [getAttribValues](#) ()

Gets the value of the attribValues property.

Returns:

possible object is [AttribValues](#)

void [setAttribName](#) (java.lang.String value)

Sets the value of the attribName property.

Parameters:

value	allowed object is java.lang.String
-------	--

void [setAttribValues](#) ([AttribValues](#) value)

Sets the value of the attribValues property.

Parameters:

<i>value</i>	allowed object is AttribValues
--------------	--

CustomAttributes Class Reference

-

Detailed Description

CustomAttributes Schema

This schema contains information about a custom attribute defined by the customer.

XML Schema File

model/v3/xsd/common.xsd

Name	Description	Type	Included?
name	The name of the attribute.	string	Always
value	The attribute's value.	string	Always
type	The attribute's type.	CustomAttributeTypeEnum	Always

Member Function Documentation

java.lang.String getName ()

Gets the value of the name property.

Returns:

possible object is [java.lang.String](#)

[CustomAttributeTypeEnum](#) getType ()

Gets the value of the type property.

Returns:

possible object is [CustomAttributeTypeEnum](#)

java.lang.String getValue ()

Gets the value of the value property.

Returns:

possible object is [java.lang.String](#)

void setName (java.lang.String value)

Sets the value of the name property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setType ([CustomAttributeTypeEnum](#) value)

Sets the value of the type property.

Parameters:

<i>value</i>	allowed object is CustomAttributeTypeEnum
--------------	---

void setValue (java.lang.String value)

Sets the value of the value property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

CustomAttributes Class Reference

Public Member Functions

- `java.util.List<CustomAttribute> getCustomAttribute ()`
-

Detailed Description

CustomAttributes Schema

This schema contains [CustomAttributes](#) definition.

XML Schema File

`model/v12/xsd/common.xsd`

Name	Description	Type
<code>customAttribute</code>	custom attributes details	CustomAttribute

Member Function Documentation

`java.util.List<CustomAttribute> getCustomAttribute ()`

Gets the value of the customAttribute property.

This accessor method returns a reference to the live list, not a snapshot. Therefore any modification you make to the returned list will be present inside the JAXB object. This is why there is not a `set` method for the customAttribute property.

For example, to add a new item, do as follows:

```
getCustomAttribute() .add(newItem);
```

Objects of the following type(s) are allowed in the list [CustomAttribute](#)

CustomAttributes Class Reference

Public Member Functions

-

Detailed Description

CustomAttributes Schema

This schema contains [CustomAttributes](#) definition.

XML Schema File

`model/v15/xsd/common.xsd`

Name	Description	Type
<code>customAttribute</code>	custom attributes details	CustomAttribute

Member Function Documentation

`java.util.List<CustomAttribute> getCustomAttribute ()`

Gets the value of the customAttribute property.

This accessor method returns a reference to the live list, not a snapshot. Therefore any modification you make to the returned list will be present inside the JAXB object. This is why there is not a `set` method for the customAttribute property.

For example, to add a new item, do as follows:

```
getCustomAttribute() .add(newItem);
```

Objects of the following type(s) are allowed in the list [CustomAttribute](#)

CustomAttributeTypeEnum Enum Reference

Detailed Description

CustomAttributeTypeEnum Schema

Values of custom attributes can only be strings or integers.

XML Schema File

model/v3/xsd/common.xsd

Type	Description	Type	Included?
string	Represents a string type.	Enumerated value	Always
integer	Represents an integer type.	Enumerated value	Always

Java class for [CustomAttributeTypeEnum](#).

The following schema fragment specifies the expected content contained within this class.

```
<simpleType name="CustomAttributeTypeEnum"> <restriction
base="{http://www.w3.org/2001/XMLSchema}string"> <enumeration value="string"/> <enumeration
value="integer"/> </restriction></simpleType>
```

Detailed Description

Customer Schema

This schema contains [Customer](#) type details.

XML Schema File

model/v12/xsd/interaction/customer.xsd

Name	Description	Type
id	ID of the requested customer	Long
link	self link	Link
cases	Link to fetch cases of the requested customer	Cases
customerName	Name of the customer	String
department	ID, name and link of the department	Department
type	Type and type-specific details of the customer	Type
group	Details specific to group customer	GroupInfo
corporate	Details specific to corporate customer	CorporateInfo
level	Level of the customer	L10NString
preferredAgent	ID and name of the preferred agent for the requested customer	User
role	Internal value and display value of the role of the customer	L10NString
pin	Customer pin information	String
howReferred	Specifies how the customer was referred	L10NString
created	Creation details of the customer	DateAndUser
lastModified	Last modification details of the customer	DateAndUser
industry	Industry that this customer belongs to	L10NString
marketSegment	Market segment of the customer	String
entitlements	Entitlements of the customer	String
customAttributes	Name and value of all the custom attributes configured for the Customer Object	CustomAttributes
contactPersons	Details of all contact persons associated with the requested customer	ContactPersons
contacts	Details of all contacts associated with the requested customer	Contacts

Member Function Documentation

[Cases](#) `getCases ()`

Gets the value of the cases property.

Returns:

possible object is [Cases](#)

[ContactPersons](#) `getContactPersons ()`

Gets the value of the contactPersons property.

Returns:

possible object is [ContactPersons](#)

[Contacts](#) `getContacts ()`

Gets the value of the contacts property.

Returns:

possible object is [Contacts](#)

[CorporateInfo](#) `getCorporate ()`

Gets the value of the corporate property.

Returns:

possible object is [CorporateInfo](#)

[DateAndUser](#) `getCreated ()`

Gets the value of the created property.

Returns:

possible object is [DateAndUser](#)

[CustomAttributes](#) `getCustomAttributes ()`

Gets the value of the customAttributes property.

Returns:

possible object is [CustomAttributes](#)

`java.lang.String` `getCustomerName ()`

Gets the value of the customerName property.

Returns:

possible object is [java.lang.String](#)

[Department](#) `getDepartment ()`

Gets the value of the department property.

Returns:

possible object is [Department](#)

java.lang.String getEntitlements ()

Gets the value of the entitlements property.

Returns:

possible object is [java.lang.String](#)

[GroupInfo](#) getGroup ()

Gets the value of the group property.

Returns:

possible object is [GroupInfo](#)

[L10NString](#) getHowReferred ()

Gets the value of the howReferred property.

Returns:

possible object is [L10NString](#)

long getId ()

Gets the value of the id property.

Returns:

possible object is [Long](#)

[L10NString](#) getIndustry ()

Gets the value of the industry property.

Returns:

possible object is [L10NString](#)

[DateAndUser](#) getLastModified ()

Gets the value of the lastModified property.

Returns:

possible object is [DateAndUser](#)

[L10NString](#) getLevel ()

Gets the value of the level property.

Returns:

possible object is [L10NString](#)

[Link](#) getLink ()

Gets the value of the link property.

Returns:

possible object is [Link](#)

java.lang.String getMarketSegment ()

Gets the value of the marketSegment property.

Returns:

possible object is [java.lang.String](#)

java.lang.String getPin ()

Gets the value of the pin property.

Returns:

possible object is [java.lang.String](#)

[User](#) getPreferredAgent ()

Gets the value of the preferredAgent property.

Returns:

possible object is [User](#)

[L10NString](#) getRole ()

Gets the value of the role property.

Returns:

possible object is [L10NString](#)

[Type](#) getType ()

Gets the value of the type property.

Returns:

possible object is [Type](#)

void setCases ([Cases](#) value)

Sets the value of the cases property.

Parameters:

<i>value</i>	allowed object is Cases
--------------	---

void setContactPersons ([ContactPersons](#) value)

Sets the value of the contactPersons property.

Parameters:

<i>value</i>	allowed object is ContactPersons
--------------	--

void setContacts ([Contacts](#) value)

Sets the value of the contacts property.

Parameters:

<i>value</i>	allowed object is Contacts
--------------	--

void setCorporate ([CorporateInfo](#) value)

Sets the value of the corporate property.

Parameters:

<i>value</i>	allowed object is CorporateInfo
--------------	---

void setCreated ([DateAndUser](#) value)

Sets the value of the created property.

Parameters:

<i>value</i>	allowed object is DateAndUser
--------------	---

void setCustomAttributes ([CustomAttributes](#) value)

Sets the value of the customAttributes property.

Parameters:

value	allowed object is CustomAttributes
-------	--

void setCustomerName (java.lang.String value)

Sets the value of the customerName property.

Parameters:

value	allowed object is java.lang.String
-------	--

void setDepartment ([Department](#) value)

Sets the value of the department property.

Parameters:

value	allowed object is Department
-------	--

void setEntitlements (java.lang.String value)

Sets the value of the entitlements property.

Parameters:

value	allowed object is java.lang.String
-------	--

void setGroup ([GroupInfo](#) value)

Sets the value of the group property.

Parameters:

value	allowed object is GroupInfo
-------	---

void setHowReferred ([L10NString](#) value)

Sets the value of the howReferred property.

Parameters:

value	allowed object is L10NString
-------	--

void setId (long value)

Sets the value of the id property.

Parameters:

value	allowed object is Long
-------	--

void setIndustry ([L10NString](#) value)

Sets the value of the industry property.

Parameters:

value	allowed object is L10NString
-------	--

void setLastModified ([DateAndUser](#) value)

Sets the value of the lastModified property.

Parameters:

<i>value</i>	allowed object is DateAndUser
--------------	---

void setLevel ([L10NString](#) *value*)

Sets the value of the level property.

Parameters:

<i>value</i>	allowed object is L10NString
--------------	--

void setLink ([Link](#) *value*)

Sets the value of the link property.

Parameters:

<i>value</i>	allowed object is Link
--------------	--

void setMarketSegment (java.lang.String *value*)

Sets the value of the marketSegment property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setPin (java.lang.String *value*)

Sets the value of the pin property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setPreferredAgent ([User](#) *value*)

Sets the value of the preferredAgent property.

Parameters:

<i>value</i>	allowed object is User
--------------	--

void setRole ([L10NString](#) *value*)

Sets the value of the role property.

Parameters:

<i>value</i>	allowed object is L10NString
--------------	--

void setType ([Type](#) *value*)

Sets the value of the type property.

Parameters:

<i>value</i>	allowed object is Type
--------------	--

--------------	--

void setPreferredAgent ([User](#) *value*)

Sets the value of the preferredAgent property.

Parameters:

<i>value</i>	allowed object is User
--------------	--

void setRole ([L10NString](#) *value*)

Sets the value of the role property.

Parameters:

<i>value</i>	allowed object is L10NString
--------------	--

void setType ([Type](#) *value*)

Sets the value of the type property.

Parameters:

<i>value</i>	allowed object is Type
--------------	--

CustomerAuthenticationSection Class Reference

Detailed Description

Authentication

Authentication is required. The customer must be logged in to call this API. Each API request must contain X-egain-session request header returned by Login API.

CustomerAutoProvisioningPage Class Reference

Detailed Description

Creation of new customer during SSO login

If a customer is not found in the ECE application with the *subject* provided in the SAML assertion, the application will check whether *mergeOnAttribute* SAML attribute is provided. If provided, the application uses the field specified in *mergeOnAttribute* to search for a customer.

If a customer is found using *mergeOnAttribute* then this customer's information will be updated with all the customer attributes sent in the SAML Assertion and the customer identifier sent in the *subject*. If the customer is not found using *subject* and *mergeOnAttribute* both, a new customer is created in the application. The customer type will be individual.

Following customer attributes are required to be sent in the SAML attributes to create a new customer successfully:

Attribute Name	Description
department	Department name in which to lookup the customer. This must be provided only if the customer departmentalization setting is enabled in the application.
firstName	First name of the contact. Must not exceed 124 characters.

Following optional customer attributes are allowed in the SAML attributes to create a new customer:

Attribute Name	Description
middleName	Middle name of the contact. Must not exceed 124 characters.
lastName	Last name of the contact. Must not exceed 124 characters.
dateOfBirth	Must be a date in the past. Must be in XML date format (yyyy-mm-dd).
custom.<name>	Custom attributes of the contact: "<name>" is the internal name of the custom attribute. Name must match one of the custom attributes configured in application. If the custom attribute is configured as an enumeration, the value must be one of the predefined values.
email.address	Email address of the contact. Refer Email Address definition for the valid email address format.
twitter.ID	Twitter ID of the contact. Must not exceed 255 characters.
facebook.ID	Facebook ID of the contact. Must not

	exceed 255 characters.
home.phone.countryCode	Country code of the home phone number of the contact. Must be a number not exceeding 9 digits.
home.phone.number	Home phone number of the contact. This accepts any string representation. It is the client's responsibility to send in the correct number. Must not exceed 25 characters.
mobile.phone.countryCode	Country code of the mobile phone number of the contact. Must be a number not exceeding 9 digits.
mobile.phone.number	Mobile phone number of the contact. This accepts any string representation. It is the client's responsibility to send in the correct number. Must not exceed 25 characters.
office.phone.countryCode	Country code of the office phone number of the contact. Must be a number not exceeding 9 digits.
office.phone.number	Office phone number of the contact. This accepts any string representation. It is the client's responsibility to send in the correct number. Must not exceed 25 characters.
mergeOnAttribute	Attribute on which existing customer records will be merged. Supported values are: <ul style="list-style-type: none"> • email.address • home.phone.number • mobile.phone.number • office.phone.number • custom.<name>

Modification of existing customer during SSO login

If a single customer is found in the ECE application with the *subject* provided or by using the *mergeOnAttribute* in the SAML assertion, the customer information is updated using the customer attributes in SAML attributes and the customer identifier sent in the *subject*.

Following optional customer attributes are allowed in the SAML Attributes to modify an existing customer:

Attribute Name	Description
department	Department name in which to lookup the customer. This must be provided only if the customer departmentalization setting is enabled in the application.
firstName	First name of the contact. Must not exceed 124 characters. Must be provided to create a new customer in the application.

middleName	Middle name of the contact. Must not exceed 124 characters.
lastName	Last name of the contact. Must not exceed 124 characters.
dateOfBirth	Must be a date in the past. Must be in XML date format (yyyy-mm-dd).
custom.<name>	Custom attributes of the contact: "<name>" is the internal name of the custom attribute. Name must match one of the custom attributes configured in application. If the custom attribute is configured as an enumeration, the value must be one of the predefined values.
email.address	Email address of the contact. Refer Email Address definition for the valid email address format.
twitter.ID	Twitter ID of the contact. Must not exceed 255 characters.
facebook.ID	Facebook ID of the contact. Must not exceed 255 characters.
home.phone.countryCode	Country code of the home phone number of the contact. Must be a number not exceeding 9 digits.
home.phone.number	Home phone number of the contact. This accepts any string representation. It is the client's responsibility to send in the correct number. Must not exceed 25 characters.
mobile.phone.countryCode	Country code of the mobile phone number of the contact. Must be a number not exceeding 9 digits.
mobile.phone.number	Mobile phone number of the contact. This accepts any string representation. It is the client's responsibility to send in the correct number. Must not exceed 25 characters.
office.phone.countryCode	Country code of the office phone number of the contact. Must be a number not exceeding 9 digits.
office.phone.number	Office phone number of the contact. This accepts any string representation. It is the client's responsibility to send in the correct number. Must not exceed 25 characters.
mergeOnAttribute	Attribute on which existing customer records will be merged. Supported values are: <ul style="list-style-type: none"> • email.address • home.phone.number

	<ul style="list-style-type: none">• mobile.phone.number• office.phone.number• custom.<name>
--	---

CustomerByIDsExamples Class Reference

Detailed Description

Examples for GET Customers by IDs

Example 1 - Get summary attributes of a single customer

This example demonstrates the following:

- Retrieving the summary attributes of a single individual customer.
- This example assumes "Customer departmentalization" setting is enabled. Hence, the response has the department of the customer.

XML

Request

Method	URL
GET	/ws/v12/interaction/customer/1042

Request headers

Name	Value
X-egain-session	Valid session ID
Accept	application/xml
Accept-Language	en-US

Response

HTTP/1.1 200 OK

Response headers

Name	Value
X-egain-session	current session ID
Content-Type	application/xml

Response body

Example 3 - Get all attributes for multiple customers sorted on custom attribute

This example demonstrates the following:

- Retrieving all attributes for multiple customers.
- Representation of all attributes of individual, group and corporate customer. This example also demonstrates the representation of all the attributes of contact person and all types of contact points.
- Sorting on a custom attribute in descending order

XML

Request

Method	URL
GET	/ws/v12/interaction/customer/1027,1042,1043?\$attribute=all&\$sort=custom.credit_rating&\$order=desc

Request headers

Name	Value
X-egain-session	Valid session ID
Accept	application/xml
Accept-Language	en-US

Response

HTTP/1.1 200 OK

Response headers

Name	Value
X-egain-session	current session ID
Content-Type	application/xml

Response body

```

Example 4 - Get additional attributes for a single customer

This example demonstrates the following:

- Retrieving additional attributes (including custom attribute) along with summary attributes for an individual customer.

XML

Request

Method	URL
GET	/ws/v12/interaction/customer/1042?\$attribute=level,custom.credit_rating

Request headers

Name	Value
X-egain-session	Valid session ID
Accept	application/xml
Accept-Language	en-US

Response

HTTP/1.1 200 OK

Response headers

Name	Value
X-egain-session	current session ID
Content-Type	application/xml

Response body

```
<?xml version="1.0" encoding="UTF-8" standalone="yes" ?><customers

CustomerCommonInfoPage Class Reference

Detailed Description

Supported values of some Common Query Parameters that appear in Customer Resource APIs

NOTE: each *common parameter* described below is not necessarily supported by all Customer APIs. Therefore, first refer to specific API documentation to see which *common parameters* that API supports.

Values of \$attribute common parameter supported by Customer Resource

Use `$attribute` to request additional attributes/elements of resource representation, beyond those always returned by server. The value of `$attribute` must be a comma separated list of attribute names. For example,

```
GET .../interaction/customer/1000?$attribute=level
```

```
GET .../interaction/customer/1000?$attribute=created,preferredAgent,custom.abc
```

```
GET .../interaction/customer/1000?$attribute=all
```

Name	Description	Schema/type returned by server
all	This is a special keyword that prompts server to return all available resource attributes. All attributes listed in this table as well as Additional Attributes of Contact Person and Additional Attributes of Contact Point will be returned.	N/A
level	Level of the customer	L10NString
preferredAgent	Preferred agent of the customer (ID and name)	User
role	Role of the customer (e.g., partner, reseller, customer)	L10NString
pin	Customer pin information	String
howReferred	Specifies how the customer was referred	L10NString
created	Customer creation details (user and date)	DateAndUser
industry	Industry that this customer belongs to	L10NString
marketSegment	Market segment of the	String

	customer	
entitlements	Entitlements of the customer	String
custom.<name>	Name of a custom attribute configured for customer object	CustomAttributes

Values of \$sort common parameter supported by Customer Resource

Customers returned in server response are sorted based on the attribute supplied under \$sort . See *Description* column below for specifics.

Name	Description
id	Results are sorted on customer IDs
type	Results are sorted on the type value of customer
customerName	Results are sorted on the customer name
custom.<name>	Results are sorted on supplied name of custom attribute of customer object

Summary attributes of Customer Resource

Customer Resource always returns <customers> representation, that contains one or more <customer> representations and <paginationInfo> element if applicable.

Customer summary

Name	Description	Type
id	Customer ID	Long
link	Self link that can be used to retrieve this customer	Link
cases	Field holding a link that can be used to retrieve all cases of this customer	Cases
customerName	Customer name	String
department	Department of the customer (ID and name). This is returned only if 'Customer departmentalization' setting is enabled.	Department
type	Type and type-specific details of the customer	Type
lastModified	Details of the last modification of the customer	DateAndUser

	(date and user info)	
contactPersons	All contact persons of this customer. This representation contains one or more <contactPerson> elements. See Contact Person summary below for details.	ContactPersons

Contact Person summary

Name	Description	Type
id	Contact Person ID	Long
isSystemCreated	Indicates whether this contact person was created by the system	Boolean
salutation	Contact person's salutation	String
firstName	Contact person's first name	String
middleName	Contact person's middle name	String
lastName	Contact person's last name	String
loginId	Contact person's login ID	String
lastModified	Details of the last modification of this contact person (date and user info)	DateAndUser
contactPoints	All contact points of this contact person. This representation contains one or more <contactPoint> elements. See Contact Point summary below for details.	ContactPoints

Contact Point summary

Name	Description	Type
id	Contact point ID	Long
type	Type and type-specific details of the contact point. Each type consists of value, displayValue and one of "email", "phone", "postal", "website" or "social". See Contact Point type-specific summary below for details.	Type
lastModified	Details of the last modification of the contact point (date and user info)	DateAndUser

Contact Point type-specific summary

Name	Description	Type
email	Contact person's email details (emailAddress).	Email
phone	Contact person's telephone details (type, phoneNo, countryCode, areaCode, extension, availability).	Phone
postal	Contact person's postal details (type, address_1, address_2, city, state, zip, country, region).	Postal
website	Contact person's website details (url).	Website
social	Contact person's social details (type, socialId)	Social

Additional attributes of Customer Resource

Below are additional attributes of Contact Person and Contact Point representations that are returned by server if `$attribute=all` is requested by client. None of the below attributes can be requested by name. If `$attribute=all` is not supplied in client request, only summary attributes are returned for [Contact Person](#) and [Contact Point](#) representations. However, if `$attribute=all` is provided, both summary and all additional attributes of Contact Person and Contact Point are returned in server response.

Additional Attributes of Contact Person

The following additional contact person attributes are returned under *customers -> customer -> contactPersons->contactPerson* element in server response.

Name	Description	Type/schema returned by server
jobTitle	Contact person's job title	String
employmentStatus	Contact person's employment status	L10NString
dateOfBirth	Contact person's date of birth	DateTime
gender	Contact person's gender	L10NString
maritalStatus	Marital status of the contact person	L10NString
identification	Identification details of the	Identification

	contact person	
type	Contact person's type (e.g. billing, legal, shipping etc.)	L10NString
firstNameFurigana	Contact person's first name in furigana	String
middleNameFurigana	Contact person's middle name in furigana	String
lastNameFurigana	Contact person's last name in furigana	String
suffix	Contact person's suffix	L10NString
initials	Contact person's initials	String
startGreeting	String specifying start of greeting to use for this contact person	String
endGreeting	String specifying end of greeting to use for this contact person	String
spouseName	Spouse name of the contact person	String
emergencyContact	Emergency contact information of the contact person	String
priority	Priority of this contact person	String
secretQuestion	Secret question for password retrieval	String
secretAnswer	Answer to the secret question	String
occupation	Contact person's occupation	String
incomeLevel	Contact person's income level	String
educationLevel	Contact person's education level	L10NString
race	Contact person's race	String
dependents	Dependents of the contact person	String
isSmoker	A flag indicating whether this contact person is a smoker	Boolean
hobbies	Contact person's hobbies	String
interests	Contact person's interests	String
contactOrder	Order in which this contact person should be contacted if there are multiple contact persons for the same customer	Int
hasDirectMailingConsent	A flag indicating whether direct mailing consent is given by the contact person	Boolean
hasDirectCallingConsent	A flag indicating whether direct calling consent is given by the contact person	Boolean
hasHoldingDataConsent	A flag indicating whether holding data consent is given	Boolean

	by the contact person	
customAttributes	All custom attributes available for this Contact Person	CustomAttributes

Additional Attributes of Contact Point

The following additional contact point attributes are returned under *customers -> customer -> contactPersons -> contactPerson -> contactPoints -> contactPoint* element in server response.

Name	Description	Type
priority	Priority of the contact point	L1ONString
customAttributes	All custom attributes available for this Contact Point	CustomAttributes

CustomerCommonInfoPage Class Reference

Detailed Description

Supported values of some Common Query Parameters that appear in Customer Resource APIs

NOTE: each *common parameter* described below is not necessarily supported by all Customer APIs. Therefore, first refer to specific API documentation to see which *common parameters* that API supports.

Values of \$attribute common parameter supported by Customer Resource

Use `$attribute` to request additional attributes/elements of resource representation, beyond those always returned by server. The value of `$attribute` must be a comma separated list of attribute names. For example,

```
GET .../context/interaction/customer?$attribute=role
```

```
GET .../context/interaction/customer?$attribute=industry,marketSegment,cus  
tom.abc
```

```
GET .../context/interaction/customer?$attribute=all
```

Name	Description	Schema/type returned by server
all	This is a special keyword that prompts server to return all available resource attributes. All attributes listed in this table as well as contact-additional-attributes will be returned.	N/A
role	Role of the customer (e.g., partner, reseller, customer)	L1ONString
pin	Customer pin information	String
industry	Industry that this customer belongs to	L1ONString
marketSegment	Market segment of the customer	String
entitlements	Entitlements of the customer	String
custom.<name>	Name of a custom attribute configured for customer object	CustomAttributes

Summary attributes of Customer Resource

Customer Resource always returns <customers> representation, that contains one or more <customer> representations and <paginationInfo> element if applicable.

Customer summary

Name	Description	Type
id	Customer ID	Long
link	Self link that can be used to retrieve this customer	Link
cases	Field holding a link that can be used to retrieve all cases of this customer	Cases
customerName	Customer name	String
type	Type and type-specific details of the customer	Type
lastModified	Details of the last modification of the customer (date only)	DateAndUser
contacts	All contacts of this customer. This representation contains one or more <contact> elements. See Contact summary below for details.	Contacts

Contact summary

Name	Description	Type
id	Contact ID	Long
self	Indicates whether this is the logged in contact	String
firstName	Contact's first name	String
middleName	Contact's middle name	String
lastName	Contact's last name	String
lastModified	Details of the last modification of this contact (date only)	DateAndUser
email	Email details of this contact (ID, emailAddress and lastModified). <contact> element can contain one or more <email> elements.	Email
postal	Postal details of this contact (ID, type, address_1, address_2, city, state, zip, country, region and lastModified). <contact>	Postal

	element can contain one or more <postal> elements.	
phone	Phone details of this contact (ID, type, phoneNo, countryCode, areaCode, extension and lastModified). <contact> element can contain one or more <phone> elements.	Phone
website	Website details of this contact (ID, url and lastModified). <contact> element can contain one or more <website> elements.	Website
social	Social details of this contact (ID, type, socialId and lastModified). <contact> element can contain one or more <social> elements.	Social

Additional attributes of Customer Resource

Below are additional attributes of Contact representations that are returned by server if `$attribute=all` is requested by client. None of the below attributes can be requested by name. If `$attribute=all` is not supplied in client request, only summary attributes are returned for [Contact](#) representation. However, if `$attribute=all` is provided, both summary and all additional attributes of Contact are returned in server response.

Additional Attributes of Contact

The following additional contact attributes are returned under *customers -> customer -> contacts->contact* element in server response.

Name	Description	Type/schema returned by server
salutation	Contact's salutation	String
gender	Contact's gender	L10NString
identification	Identification details of the contact	Identification
suffix	Contact's suffix	L10NString
initials	Contact's initials	String
secretQuestion	Secret question for password retrieval	String
secretAnswer	Answer to the secret question	String
hasDirectMailingConsent	A flag indicating whether direct mailing consent is	Boolean

	given by the contact	
hasDirectCallingConsent	A flag indicating whether direct calling consent is given by the contact	Boolean
hasHoldingDataConsent	A flag indicating whether holding data consent is given by the contact	Boolean
jobTitle	Contact's job title	String
employmentStatus	Contact's employment status	L10NString
priority	Priority of this contact	String
dateOfBirth	Contact's date of birth	DateTime
maritalStatus	Marital status of the contact	L10NString
type	Contact's type (e.g. billing, legal, shipping etc.)	L10NString
firstNameFurigana	Contact's first name in furigana	String
middleNameFurigana	Contact's middle name in furigana	String
lastNameFurigana	Contact's last name in furigana	String
startGreeting	String specifying start of greeting to use for this contact	String
endGreeting	String specifying end of greeting to use for this contact	String
spouseName	Spouse name of the contact	String
emergencyContact	Emergency contact information of the contact	String
occupation	Contact's occupation	String
incomeLevel	Contact's income level	String
educationLevel	Contact's education level	L10NString
race	Contact's race	String
dependents	Dependents of the contact	String
isSmoker	A flag indicating whether this contact is a smoker	Boolean
hobbies	Contact's hobbies	String
interests	Contact's interests	String
contactOrder	Order in which this contact should be contacted if there are multiple contacts for the same customer	Int
customAttributes	All custom attributes available for this contact	CustomAttributes

CustomerGrantsCommonInfo Class Reference

Detailed Description

Supported values of common parameters and attributes in the Customer Grants APIs

Summary attributes of grants resource

The response will be a "grants" representation, having a "grantsOn" and a "grantsTo" attribute. Each of "grantsOn" and "grantsTo" will be included in the response only if it consists of at least one customer.

Name	Description	Schema/type
grantsOn	This will have the customers on whom the customer provided in the URI has grants on. Each customer will have: <ul style="list-style-type: none">• id: id of the customer• link: Link to the details of the customer• customerName: Name of the customer	Customers
grantsTo	This will have the customers to whom the customer provided in the URI has provided grants. Each customer will have: <ul style="list-style-type: none">• id: id of the customer• link: Link to the details of the customer• customerName: Name of the customer	Customers

CustomerGrantsCommonInfo Class Reference

Detailed Description

Summary attributes of grants resource

The response will be a "grants" representation, having a "grantsOn" and a "grantsTo" attribute. Each of "grantsOn" and "grantsTo" will be included in the response only if it consists of at least one customer.

Name	Description	Schema/type
grantsOn	This will have the customers on whom the logged in customer has grants on. Each customer will have: <ul style="list-style-type: none">• id: id of the customer• customerName: Name of the customer	Customers
grantsTo	This will have the customers to whom the logged in customer has provided grants. Each customer will have: <ul style="list-style-type: none">• customerName: Name of the customer	Customers

CustomerGrantsInfoPage Class Reference

Detailed Description

Customer grants

Overview

A grant is an authorization given to a customer on another customer. If Customer A has grants on Customer B, then Customer A can:

1. View the activities, attachments and cases of customer B
2. Create new emails on behalf of customer B
3. Respond to emails on behalf of customer B

In terms of APIs, Customer A can execute the following APIs on behalf of Customer B

1. Activity:
 1. [Get activity by ID](#)
 2. [Search for activities](#)
 3. [Create incoming email activity](#)
 4. [Create an email response to an activity](#)
2. Activity attachments:
 1. [Get details for all attachments of an activity](#)
 2. [Get attachment details](#)
3. Case:
 1. [Get case by ID](#)
 2. [Search for cases](#)

Number of grants

A customer can have grants on at most 75 customers. Similarly, no more than 75 customers can have grants on a customer.

CustomerLoginExamples Class Reference

Detailed Description

Examples for Login Customer

Example 1 - Login a customer

This example demonstrates the following:

- Logging in a customer by providing valid credentials. This example assumes that 5 concurrent sessions for this customer do not exist, and hence, the API will be successful.

XML

Request

Method	URL
POST	/ws/v15/context/authentication/user/login

Request headers

Name	Value
Accept	application/xml
Content-Type	application/xml
Accept-Language	en-US

Request body:

```
<?xml version="1.0" encoding="UTF-8" standalone="yes"?><Login xmlns="http://bindings.egain.com/ws/model/v15/gen/platform">  <userName>customer1</userName>  <password>password@123</password></Login>
```

Response:

HTTP/1.1 204 No Content

Response headers

Name	Values
X-egain-session	Newly generated session ID
Content-Type	application/xml

JSON

Request

Method	URL
POST	/ws/v15/context/authentication/user/login

Request headers :

Name	Value
Content-Type	application/json
Accept	application/json
Accept-Language	en-US

Request body:

```
{ "userName": "customer1", "password": "password@123" }
```

Response:

HTTP/1.1 204 No Content

Response headers

Name	Values
X-egain-session	Newly generated session ID
Content-Type	application/json

Example 2 - Login a customer with forceLogin query parameter

This example demonstrates the following:

- Logging in a customer by providing valid credentials.
- Using the forceLogin query parameter in the request.

XML**Request**

Method	URL
POST	/ws/v15/context/authentication/user/login?forceLogin=yes

Request headers

Name	Value
Accept	application/xml
Content-Type	application/xml
Accept-Language	en-US

Request body:

```
<?xml version="1.0" encoding="UTF-8" standalone="yes"?><Login xmlns="http://bindings.egain.com/ws/model/v15/gen/platform">
  <userName>customer1</userName>
  <password>password@123</password></Login>
```

Response:

HTTP/1.1 204 No Content

Response headers

Name	Values
------	--------

X-egain-session	Newly generated session ID
Content-Type	application/xml

JSON

Request

Method	URL
POST	/ws/v15/context/authentication/user/login?forceLogin=yes

Request headers :

Name	Value
Content-Type	application/json
Accept	application/json
Accept-Language	en-US

Request body:

```
{ "userName": "customer1", "password": "password@123" }
```

Response:

HTTP/1.1 204 No Content

Response headers

Name	Values
X-egain-session	Newly generated session ID
Content-Type	application/json

CustomerLoginPage Class Reference

Detailed Description

Login Customer

Overview

This is an authentication API, which can be used by customers to log in to the application. Once authenticated, the customers can access Interaction APIs as well as Access APIs using the same session ID that is returned as part of the authentication.

Session ID, once expired, cannot be used again and a new session ID can be created by using this API.

Since

15.0.2

APIs

Method	URL	Description
POST	/ws/v15/context/authentication/user/login	Authenticates customers logging into the application.

Permissions

Licenses

Each of the below licenses will be consumed as part of this API. Hence, these must be installed and available for consumption:

- ECE SelfService
- ECE SelfService Advanced

Request

Request headers

Name	Description	Allowed values	Default value
Content-Type	Media type sent by the client.	application/xml or application/json or multipart/form-data	N/A
Accept	Content type	application/x	N/A

	accepted by the client.	ml or application/json	
Accept-Language	Language locale accepted by client (used for locale specific fields in resource representation and in error responses)	Supported 'Accept-Language' header codes	default system language

Request Body

The request body is mandatory. Request body can be in either XML or JSON format.

Elements required in the request body

Name	Description
userName	Login ID of the customer
password	Password corresponding to the login ID

Optional elements allowed in the request body

None

Supported API specific query parameters

Name	Description
forceLogin	This is an optional query parameter. The only possible value is "yes".the application, a maximum of 5 concurrent sessions are allowed for a customer. The sixth request will fail, unless this parameter is sent along with the request. If this parameter is sent by the client, the earliest session is terminated and a new session is created.

Supported common query parameters

None

Request body XML schemas:

- [Login Schema](#)

Response

Response headers

Name	Description	Possible values
X-egain-session	Newly generated session ID	N/A
Content-Type	Media type of response body	application/xml or application/json

Response body XML schemas:

- [Error](#) - used in case of error

HTTP status codes

Success Status codes

204 - No Content

- The customer was successfully authenticated. The new session identified will be sent as part of the response header "X-egain-session".

Failure Status codes

400 - Bad Request

- Any unsupported query parameter is sent in the request.
- The value of any of the query parameter is unsupported.
- Request body does not contain the required elements.
- An unsupported element is present in the request body.
- Request body is empty.

401 - Unauthorized

- If the customer cannot be authenticated using the supplied credentials.

403 - Forbidden

- If the user with username provided in request body currently has 5 active web service sessions and forceLogin query parameter with value "yes" is not sent in the request.

500 - Internal server error

Examples:

[Example 1 - Login a customer](#)

[Example 2 - Login a customer with forceLogin query parameter](#)

Examples for Logout Customer

Example 1 - Logout a customer when SP initiated SSO is disabled

This example demonstrates the following:

- Logging out a customer.
- Response when SP initiated single sign-on is disabled

XML

Request

Method	URL
POST	/ws/v15/context/authentication/user/logout

Request headers

Name	Value
X-egain-session	Valid session ID
Accept	application/xml
Accept-Language	en-US

Response:

HTTP/1.1 200 OK

Response headers

Name	Values
X-egain-session	terminated session ID
Content-Type	application/xml

Response body

```
<?xml version="1.0" encoding="UTF-8" standalone="yes" ?><logout xmlns="http://bindings.egain.com/ws/model/v15/gen/platform">  
<spAuthenticationEnabled>false</spAuthenticationEnabled></logout>
```

JSON

Request

Method	URL
POST	/ws/v15/context/authentication/user/logout

Request headers :

Name	Value
X-egain-session	Valid session ID
Accept	application/json
Accept-Language	en-US

Response:

HTTP/1.1 200 OK

Response headers

Name	Values
X-egain-session	terminated session ID
Content-Type	application/json

Response body

```
{ "spAuthenticationEnabled": false}
```

Example 2 - Logout a customer when SP initiated SSO is enabled

This example demonstrates the following:

- Logging out a customer.
- Response when SP initiated single sign-on is enabled.

CustomerLogoutPage Class Reference

Detailed Description

Logout Customer

Overview

This API terminates an existing customer session. This API accepts customer's session ID and terminates the session.

Once the session is terminated, given session ID is no longer valid and cannot be used in any subsequent requests.

Since

15.0.2

APIs

Method	URL	Description
POST	/ws/v15/context/authentication/user/logout	Terminates an existing customer session.

Request

Request headers

Name	Description	Allowed values	Default value
X-egain-session	Session ID obtained from Login API response header	N/A	N/A
Accept	Content type accepted by the client.	application/xml or application/json	N/A
Accept-Language	Language locale accepted by client (used for locale specific fields in resource representation and in error responses)	Supported 'Accept-Language' header codes	default system language

Request Body

Request body is not allowed.

Supported API specific query parameters

None

Supported common query parameters

None

Response

Response headers

Name	Description	Possible values
X-egain-session	Session ID that was terminated	N/A
Content-Type	Media type of response body	application/xml or application/json

Response body XML schemas:

- [Error](#) - used in case of error
- [Logout Schema](#) - used in case of success

HTTP status codes

Success Status codes

200 - OK

- The customer session was successfully terminated.

Failure Status codes

400 - Bad Request

- Any query parameter is sent in the request.
- Request body is not empty.

401 - Unauthorized

- The header X-egain-session is not supplied.
- The session identified through X-egain-session is not a customer session.
- The customer session with the value supplied in X-egain-session header is not found.

500 - Internal server error

Examples:

[Example 1 - Logout a customer when SP initiated SSO is disabled](#)

[Example 2 - Logout a customer when SP initiated SSO is enabled](#)

Customers Class Reference

Public Member Functions

- `BigInteger` [getCount](#) ()
 - `java.util.List< Customer >` [getCustomer](#) ()
 - `Link` [getLink](#) ()
 - `PaginationInfo` [getPaginationInfo](#) ()
 - `void` [setCount](#) (`BigInteger` value)
 - `void` [setLink](#) (`Link` value)
 - `void` [setPaginationInfo](#) (`PaginationInfo` value)
-

Detailed Description

Customers Schema

This schema contains [Customers](#) type details.

XML Schema File

model/v12/xsd/interaction/customer.xsd

Name	Description	Type
link	self link	Link
customer	Customer details	Customer
paginationInfo	Pagination details of customers	PaginationInfo
count	Total count of customers	Int

Member Function Documentation

`BigInteger` [getCount](#) ()

Gets the value of the count property.

Returns:

possible object is [BigInteger](#)

`java.util.List<Customer>` [getCustomer](#) ()

Gets the value of the customer property.

This accessor method returns a reference to the live list, not a snapshot. Therefore any modification you make to the returned list will be present inside the JAXB object. This is why there is not a `set` method for the customer property.

For example, to add a new item, do as follows:

```
getCustomer().add(newItem);
```

Objects of the following type(s) are allowed in the list [Customer](#)

[Link](#) getLink ()

Gets the value of the link property.

Returns:

possible object is [Link](#)

[PaginationInfo](#) getPaginationInfo ()

Gets the value of the paginationInfo property.

Returns:

possible object is [PaginationInfo](#)

void setCount (**BigInteger** value)

Sets the value of the count property.

Parameters:

<i>value</i>	allowed object is BigInteger
--------------	--

void setLink ([Link](#) value)

Sets the value of the link property.

Parameters:

<i>value</i>	allowed object is Link
--------------	--

void setPaginationInfo ([PaginationInfo](#) value)

Sets the value of the paginationInfo property.

Parameters:

<i>value</i>	allowed object is PaginationInfo
--------------	--

void setPaginationInfo ([PaginationInfo](#) value)

Sets the value of the paginationInfo property.

Parameters:

<i>value</i>	allowed object is PaginationInfo
--------------	--

CustomerSearchExamples Class Reference

Detailed Description

Examples for Customer Search

Example 1 - Search for customers by phone number with pagination parameters

This example demonstrates the following:

- Search for customers based on the phone number of their contact point.
- Sorting on customer type, in descending order
- Explicitly specifying the pagination parameters.
- Representation of the summary attributes of the customer
- Representation of paginated response, with links to previous and next pages.

Example 2 - Search for customers by email address

This example demonstrates the following:

- Search for customers based on the email address of their contact point.
- Default sorting (on customerID, in ascending order)
- Specifying all attributes to be returned, and the representation of all the attributes in the response.

Example 3 - Search for customers by custom attribute with range parameters

This example demonstrates the following:

- Search for customers on a custom attribute. In this example, we search on custom attribute credit_rating with the value of 'Good'.
- Specifying the range parameters. Since range parameters are specified, the response does not contain paginationInfo node.
- Sorting on a custom attribute, using default order (ascending order).
- Specifying additional attributes to be sent in the response. In this example, the additional attributes level and custom attribute credit_rating. This also shows the representation of the additional attributes in the response.

Example 4 - Search for customers by phone number and custom attribute

This example demonstrates the following:

- Search for customers based on the phone number of their contact point and custom attribute credit_rating.
- Default sorting (sorting on customer ID in ascending order).
- Specifying an additional custom attribute to be returned, along with the summary attributes. In this example, the additionally requested custom attribute is credit_rating.

CustomerSearchPage Class Reference

Detailed Description

Customer Search

Overview

This API allows users to search for customers based on various criteria. If no customers match the search criteria, the server will respond with 204 success code and an empty body. This API only supports exact match searches; partial matches are not supported. For example, if a client searches for customers with email address paul@example.com, only customers with contact point value of paul@example.com will be returned. The customer with contact point value of dean.paul@example.com will not be returned.

Since:

11.6

APIs

Method	URL	Description
GET	/ws/v12/interaction/customer?phone={VAL}	Retrieve customers based on one phone number of the customer's contact point: {VAL}
GET	/ws/v12/interaction/customer?email={VAL}	Retrieve customers based on one email address of the customer's contact point: {VAL}
GET	/ws/v12/interaction/customer?custom.<name>e>={VAL}	Retrieve customers having custom attribute <name> with value: {VAL}

NOTE: You can mix and match one or more filter criteria listed above in any order. If more than one filter criteria are used, then response will only contain customers that satisfy all filter criteria.

Authentication

Authentication is required. The client must be logged in to call this API. Each API request must contain X-again-session request header returned by Login API.

Permissions

All of the following are required:

- 'View Agent Console' action.
- If customer departmentalization setting is set to "Yes", only customers which belong to either the user's home department, or to the department where the user is a foreign user will be returned.

Licenses

The logged in user must have the following licenses:

- ECE CIH Platform

Request

Request headers

Name	Description	Allowed values	Default value
X-egain-session	Session ID obtained from Login API response header	N/A	N/A
Accept	Content type accepted by client	application/xml or application/json	N/A
Accept-Language	Language locale accepted by client (used for locale specific fields in resource representation and in error responses)	Supported 'Accept-Language' header codes	default system language

Supported API specific query parameters

One or more query parameters listed below can be supplied per API call:

- **phone:** a phone number of a contact person's contact point to be used in customer search. All customer's contact persons and their contact points will be scanned to find matches.
- **email:** an email address of a contact person's contact point to be used in customer search. All customer's contact persons and their contact points will be scanned to find matches.
- **custom** .<name>: custom attribute value for custom attribute <name> of a customer to be used in case search.

Supported common query parameters

Refer to [Supported Common Query Parameters in ECE REST API](#) page for detailed description of each common parameter listed below.

- \$attribute - [Values of \\$attribute common parameter supported by Customer Resource](#)
- \$sort - [Values of \\$sort common parameter supported by Customer Resource](#)
- \$order
- \$pagenum
- \$pagesize
- \$rangestart
- \$rangesize

Response

Response headers

Name	Description	Possible values
X-egain-session	Session ID of the current user session	N/A
Content-Type	Media type of response body	application/xml or application/json

Response body XML schemas:

- [Customers Schema](#) - used in case of success
- [Error](#) - used in case of error

Summary attributes

[Summary attributes of Customer Resource](#)

Additional attributes returned in server response if explicitly requested by client

Server can be prompted to return additional attributes of resource representation using `$attribute` common query parameter. [Values of \\$attribute common parameter supported by Customer Resource](#) for the list of allowed attribute names.

HTTP status codes

Success Status codes

200 - OK

- Matches are found for this search and returned in the response body.

204 - No Content

- No matches were found for given search criteria.
- Matches found for this search, however the requested page or range doesn't contain any results.

Failure Status codes

400 - Bad Request

- Unsupported query parameter is sent in the request.
- Unsupported value for query parameter is sent in the request.
- None of the API specific query parameter is provided (since at least one search criterion is required).
- Unsupported combination of common query parameters (`$order` provided without `$sort`, mixing of pagination and range parameters etc.).

401 - Unauthorized

- X-egain-session request header is missing.
- Session is invalid or expired.

403 - Forbidden

- The user does not have sufficient permissions. Refer the "Permissions" section for details.

406 - Not Acceptable

- Invalid 'Accept-Language' header value.

500 - Internal server error

Examples:

[Example 1 - Search for customers by phone number with pagination parameters](#)

[Example 2 - Search for customers by email address](#)

[Example 3 - Search for customers by custom attribute with range parameters](#)

[Example 4 - Search for customers by phone number and custom attribute](#)

CustomerSSOLoginExamples Class Reference

Detailed Description

Examples for Login Customer using Single Sign-On(SSO)

Example 1 - Login an existing customer using SSO

This example demonstrates the following:

- Login a customer using SSO when customer doesn't need to be created or updated.
- Here customer is identified through the value provided in the *subject* attribute in SAML assertion.

This example assumes that 5 concurrent sessions for this customer do not exist, hence the API will be successful.

XML

Request

Method	URL
POST	/ws/v15/context/authentication/user/sso/oauth2/token

Request headers

Name	Value
Accept	application/xml
Content-Type	application/x-www-form-urlencoded
Accept-Language	en-US

Request body:

Following form parameters are sent in the request. For easier understanding, the SAML assertion is shown without Base64 encoding below.

Example 2 - Login a new customer with supported query parameters

This example demonstrates the following:

- Login a customer using SSO, when customer doesn't exist and will be created as part of the completing the request.
- Sending customer identifier in the *subject* of SAML assertion.
- Using the forceLogin query parameter in the request.
- Using the providerId query parameter in the request.

This example assumes that *subject* sent in the SAML assertion is not associated to any customer in the application, hence a new customer will be created with the provided SAML attributes.

Response:

HTTP/1.1 200 OK

Response headers

Name	Values
X-egain-session	Newly generated session ID
Content-Type	application/json

Response body

```
{  "access_token": "ffeb110f-87ed-4532-a8d4-37d250144a17",  "token_type": "Bearer"}
```

Example 3 - Login an existing customer using SSO with customer updation

This example demonstrates the following:

- Login a customer using SSO, when customer exists and will be updated as part of completing the request.
- Sending *mergeOnAttribute* SAML attribute with value 'email.address'

This example assumes the following:

- *Subject* sent in the SAML assertion is not found and customer is identified through the value provided in *email.address* SAML attribute.
- Less than 5 concurrent sessions exist for this customer.

XML

Request

Method	URL

CustomerSSOLoginPage Class Reference

Detailed Description

Single Sign-On using SAML bearer token

Overview

This is an authentication API, which can be used by the customers to login using Single Sign-On (SSO) to access Interaction APIs and Access APIs. This API supports logging in using a SAML2 bearer token using OAuth2. To use this API for customer login, *Customer Single Sign-On Configuration* must be configured by the administrator. Refer to "Customer Single Sign-On" section in "Administrator's Guide to Administration Console" for more information.

Upon successful verification of the SAML assertion, this API will generate a session ID which will be returned as a header. This session ID can be used by the customers to access Customer Portal APIs as well as Access APIs. Session ID, once expired, cannot be used again and a new session ID can be created by using this API.

As part of login using SSO, customer auto provisioning is also supported. With auto provisioning, customer attributes sent in SAML assertion will be used to create customers the first time they try to log in. If the customer exists, customer attributes sent in SAML assertion will be updated for the identified customer.

Since

15.0.2.1

APIs

Method	URL	Description
POST	/ws/v15/context/authentication/user/sso/oauth2/token	Authenticates customers logging into the application using SSO.

Permissions

Licenses

Following licenses will be consumed as part of this API. These must be installed and available for consumption:

- ECE SelfService
- ECE SelfService Advanced

Request

Request headers

Name	Description	Allowed values	Default value
Content-Type	Media type sent by the client.	application/x-www-form-urlencoded	N/A
Accept	Content type accepted by the client.	application/xml or application/json	N/A
Accept-Language	Language locale accepted by client (used for locale specific fields in resource representation and in error responses)	Supported 'Accept-Language' header codes	default system language

Request Body

The request body is mandatory. Request body must contain a single form with the following parameters:

- **grant_type:** This form parameter must contain the type of grant sent in the request. Only supported value is "urn:ietf:params:oauth:grant-type:saml2-bearer".
- **assertion:** This form parameter must contain a Base64 encoded SAML assertion. The customer identifier must be located in the *NameID* element of the *subject* statement of SAML assertion. SAML assertion may optionally contain customer attributes as SAML Attributes to create or modify a customer. If customer attributes are not provided, auto provisioning and modification to customer record will not happen as part of SSO.

Creation of new customer during SSO login

If a customer is not found in the ECE application with the *subject* provided in the SAML assertion, the application will check whether *mergeOnAttribute* SAML attribute is provided. If provided, the application uses the field specified in *mergeOnAttribute* to search for a customer. If a customer is found using *mergeOnAttribute* then this customer's information will be updated with all the customer attributes sent in the SAML Assertion and the customer identifier sent in the *subject*. If the customer is not found using *subject* and *mergeOnAttribute* both, a new customer is created in the application. The customer type will be individual.

Following customer attributes are required to be sent in the SAML attributes to create a new customer successfully:

Attribute Name	Description
department	Department name in which to lookup the customer. This must be provided only if the customer departmentalization setting is enabled in the application.
firstName	First name of the contact. Must not exceed 124 characters.

Following optional customer attributes are allowed in the SAML attributes to create a new customer:

Attribute Name	Description
middleName	Middle name of the contact. Must not exceed 124 characters.
lastName	Last name of the contact. Must not exceed 124 characters.
dateOfBirth	Must be a date in the past. Must be in XML date format (yyyy-mm-dd).
custom.<name>	Custom attributes of the contact: "<name>" is the internal name of the custom attribute. Name must match one of the custom attributes configured in application. If the custom attribute is configured as an enumeration, the value must be one of the predefined values.
email.address	Email address of the contact. Refer Email Address definition for the valid email address format.
twitter.ID	Twitter ID of the contact. Must not exceed 255 characters.
facebook.ID	Facebook ID of the contact. Must not exceed 255 characters.
home.phone.countryCode	Country code of the home phone number of the contact. Must be a number not exceeding 9 digits.
home.phone.number	Home phone number of the contact. This accepts any string representation. It is the client's responsibility to send in the correct number. Must not exceed 25 characters.
mobile.phone.countryCode	Country code of the mobile phone number of the contact. Must be a number not exceeding 9 digits.
mobile.phone.number	Mobile phone number of the contact. This accepts any string representation. It is the client's responsibility to send in the correct number. Must not exceed 25 characters.
office.phone.countryCode	Country code of the office phone number of the contact. Must be a number not exceeding 9 digits.
office.phone.number	Office phone number of the contact. This accepts any string representation. It is the client's responsibility to send in the correct number. Must not exceed 25 characters.
mergeOnAttribute	Attribute on which existing customer

	records will be merged. Supported values are: <ul style="list-style-type: none"> • email.address • home.phone.number • mobile.phone.number • office.phone.number • custom.<name>
--	---

Modification of existing customer during SSO login

If a single customer is found in the ECE application with the *subject* provided or by using the *mergeOnAttribute* in the SAML assertion, the customer information is updated using the customer attributes in SAML attributes and the customer identifier sent in the *subject*.

Following optional customer attributes are allowed in the SAML Attributes to modify an existing customer:

Attribute Name	Description
department	Department name in which to lookup the customer. This must be provided only if the customer departmentalization setting is enabled in the application.
firstName	First name of the contact. Must not exceed 124 characters. Must be provided to create a new customer in the application.
middleName	Middle name of the contact. Must not exceed 124 characters.
lastName	Last name of the contact. Must not exceed 124 characters.
dateOfBirth	Must be a date in the past. Must be in XML date format (yyyy-mm-dd).
custom.<name>	Custom attributes of the contact: "<name>" is the internal name of the custom attribute. Name must match one of the custom attributes configured in application. If the custom attribute is configured as an enumeration, the value must be one of the predefined values.
email.address	Email address of the contact. Refer Email Address definition for the valid email address format.
twitter.ID	Twitter ID of the contact. Must not exceed 255 characters.
facebook.ID	Facebook ID of the contact. Must not exceed 255 characters.
home.phone.countryCode	Country code of the home phone number of the contact. Must be a number not exceeding 9 digits.

home.phone.number	Home phone number of the contact. This accepts any string representation. It is the client's responsibility to send in the correct number. Must not exceed 25 characters.
mobile.phone.countryCode	Country code of the mobile phone number of the contact. Must be a number not exceeding 9 digits.
mobile.phone.number	Mobile phone number of the contact. This accepts any string representation. It is the client's responsibility to send in the correct number. Must not exceed 25 characters.
office.phone.countryCode	Country code of the office phone number of the contact. Must be a number not exceeding 9 digits.
office.phone.number	Office phone number of the contact. This accepts any string representation. It is the client's responsibility to send in the correct number. Must not exceed 25 characters.
mergeOnAttribute	Attribute on which existing customer records will be merged. Supported values are: <ul style="list-style-type: none"> • email.address • home.phone.number • mobile.phone.number • office.phone.number • custom.<name>

Supported API specific query parameters

Name	Description
forceLogin	This is an optional query parameter. The only possible value is "yes".the application, a maximum of 5 concurrent sessions are allowed for a customer. The sixth request will fail, unless this parameter is sent along with the request. If this parameter is sent by the client, the oldest session (based on session creation time) is terminated and a new session is created.
providerId	This is an optional query parameter. If provided, this must contain the ID of the provider to be used for authenticating the

	request. If this parameter is not provided, default provider will be used for authenticating the request.
--	---

Supported common query parameters

None

Request body XML schemas:

The Base64 decoded *assertion* form parameter sent in the request body must conform to [SAML 2.0 assertion schema](#). It is assumed that all mandatory SAML assertion elements required to successfully verify the SAML assertion will be sent in the request.

Response

Response will contain the following elements in case of success:

- `access_token`: The value will be the new session identifier created for the customer.
- `token_type`: The type of token returned in the response. The value will always be "Bearer".

Response will contain the following elements in case of error:

- `error`: The values can be one of: `invalid_request`, `unsupported_grant_type`, `invalid_grant`, `access_denied`, and `server_error`.
- `error_description`: Localized user friendly error message.

Response headers

Name	Description	Possible values
X-egain-session	Newly generated session ID	N/A
Content-Type	Media type of response body	application/xml or application/json

Response body XML schemas:

- [OAuth Login Response Schema](#) - used in case of success and error

HTTP status codes

Success Status codes

200 - OK

- The customer was successfully authenticated. The new session identifier will be sent in the response body as well as in the "X-egain-session" response header.

Failure Status codes

400 - Bad Request, with error value "invalid_request"

- Unsupported query or form parameter is sent in the request.
- Unsupported query or form parameter value is sent in the request.
- Request body does not contain the required form parameter.
- Request body is empty.
- If the customer is not found (based on *subject* or *mergeOnAttribute*) and SAML attributes required to create a new customer are not present in the SAML assertion.

- Unsupported SAML attribute is sent in the SAML assertion.
- Unsupported SAML attribute value is sent in the SAML assertion.
- If the customer cannot be uniquely identified with the provided *subject* or *mergeOnAttribute* in the SAML assertion.
- If duplicate email address is provided in the SAML assertion.

400 - Bad Request, with error value "unsupported_grant_type"

- Unsupported value of "grant_type" form parameter is sent.

401 - Unauthorized with error as "invalid_grant"

- Unsupported element is sent in the SAML assertion.
- Element values sent in the SAML assertion do not match the corresponding Customer SSO configuration values in admin console.
- Invalid certificate found in SAML assertion.
- SAML assertion is expired.
- SAML assertion is not Base64 encoded.
- Invalid SAML entity is sent in the SAML assertion.
- *Subject* value is empty in the SAML assertion.

403 - Forbidden with error as "access_denied"

- If the customer identified by the SAML assertion provided in request body, currently has 5 active web service sessions and forceLogin query parameter with value "yes" is not sent in the request.
- If the customer identified by the SAML assertion provided in request body is a system created or anonymous customer.

406 - Not Acceptable, with error as "invalid_request"

- Invalid value of Accept-Language header.

500 - Internal server error, with error as "server_error"

[Example 2 - Login a new customer with supported query parameters](#)

[Example 3 - Login an existing customer using SSO with customer updation](#)

CustomerWebprofileSSOLoginPage Class Reference

Detailed Description

Single Sign-On using SAML

Overview

This is the Assertion Consumer Service URL provided for web based customers to login to the application using Single Sign-On (SSO). The application supports both Identity provider (IdP) initiated SSO and Service provider (SP) initiated SSO. Only SAML 2.0 protocol is supported. To use this URL for login, *Customer Single Sign-On Configuration* must be configured by the administrator. Refer to "Customer Single Sign-On" section in "Administrator's Guide to Administration Console" for more information.

Once the login is successful, the customers can access Interaction APIs as well as Access APIs using the session token returned through a short lived cookie in the response.

As part of login, customer auto provisioning is also supported. With auto provisioning, customer attributes sent in SAML assertion will be used to create customers the first time they try to log in. If the customer exists, customer attributes sent in SAML assertion will be updated for the identified customer.

Since

15.0.3.1

Permissions

Licenses

Following licenses will be consumed as part of logging in the customer. These must be installed and available for consumption:

- ECE SelfService
- ECE SelfService Advanced

Request

Request URL

Method	URL	Description
POST	/authentication/sso/saml2	Authenticate and login customers using SSO.

Request Body

The request body is mandatory. Request body must contain a single form with the following

parameters:

1. SAMLResponse: This form parameter must contain a Base64 encoded SAML assertion. SAML assertion may optionally contain the following:
 1. Customer attributes to create or modify a customer. Please refer [Auto provisioning and update of customers](#) for more information on supported attributes.
 2. Start URL: This is an absolute URL that the customer will be redirected to upon successfully logging in. The URL can be sent in 'startURL' attribute in the assertion.
 3. applicationType: This indicates the application which the user wants to login to. Only Secure Inbox is currently supported, and hence, the parameter value must be 'secure_inbox'.
 4. portalId: ID of the portal. This is supported only if the value of applicationType is "secure_inbox". This will override the value provided through the "portalId" request parameter.
 5. templateName: Name of the template. This is supported only if the value of applicationType is "secure_inbox". This will override the value provided through the "templateName" request parameter.
2. applicationType: This need not be provided, if already provided through SAML assertion. This form parameter indicates the application which the user wants to login to. Only Secure Inbox is supported in this version hence, the parameter value must be 'secure_inbox'.

Note: ApplicationType is mandatory either as a form parameter, or as part of the SAML assertion in SAMLResponse. The value provided must be a supported value. The application accepts the request even if applicationType is provided as form parameter as well as in the SAML assertion.

Request Body XML schemas

SAMLResponse form parameter in the request body must use the following SAML 2.0 assertion schema:

- <https://docs.oasis-open.org/security/saml/v2.0/saml-schema-assertion-2.0.xsd>

Supported parameters

Following optional parameters are allowed for all application types in the request. These parameters can be sent as form or query parameters:

Name	Description	Allowed values	Default value
RelayState	This parameter must contain an absolute URL where the customer will be redirected to after a successful login. Note that this will take precedence over "startURL" provided through the SAML assertion.	N/A	N/A
forceLogin	This is an optional query parameter. The only possible value is "yes".the	N/A	N/A

	application, a maximum of 5 concurrent sessions are allowed for a customer. The sixth request will fail, unless this parameter is sent along with the request. If this parameter is sent by the client, the oldest session (based on session creation time) is terminated and a new session is created.		
acceptLanguage	This parameter must contain the language locale accepted by client (used for locale specific error responses).	Supported 'Accept-Language' header codes	default system language
providerId	ID of the provider to be used for authenticating the request.	ID of a configured provider in the application.	Default provider, as configured in the application.

Following optional parameters are allowed for 'secure_inbox' application type in the request. These parameters will be appended to the start URL (as query parameters), if the customer is authenticated successfully.

Name	Description
templateName	Name of the template.
portalId	PortalID

Note: Values for "templateName" and "portalId" can be provided through request parameter as well as SAML assertion. If provided through both (request parameter and SAML assertion), the value in the SAML assertion will take precedence (value in SAML assertion will be used).

Response

If login is successful:

- The customer will be redirected (response code 302) to a start URL. Start URL will be appended with all application specific parameters that are sent in the request. This start URL will be determined in the following order of precedence:
 - RelayState parameter: If 'RelayState' parameter is sent in the request, it will be used as the start URL.

- SAML assertion attribute: If 'RelayState' parameter is not sent and 'startURL' SAML attribute is present in the SAML assertion sent in the request, the value sent for this SAML attribute will be used as the start URL.
 - Admin console settings: If both 'RelayState' parameter and 'startURL' SAML assertion attribute are not sent, start URL will be the value of 'Start URL' setting configured in admin console for customer SSO configuration.
 - **Note:** If start URL is not sent or configured in at least one of the above mentioned parameters, the customer will be redirected to the error page.
2. As part of the response, a short lived cookie (alive for 1 minute) named 'X-again-session' will be set by the application. This cookie will contain the session token generated for the customer. This token must be stored by the client and sent as a header in all subsequent Interaction and Access API calls.

If login is not successful:

- The customer will be redirected (response code 302) to a standard error page. This error page will display an error code and a user friendly error description localized in the language sent in 'Accept-language' query parameter. If 'Accept-language' query parameter is not sent in the request, error description will be returned in the default system language.

Errors

Below are a few scenarios in which the application will error out:

- Unsupported query or form parameter is sent in the request.
- Unsupported query or form parameter value is sent in the request.
- Request body does not contain the required form parameter.
- Request body is empty.
- The customer is not found (based on subject or mergeOnAttribute) and SAML attributes required to create a new customer are not present in the SAML assertion.
- Unsupported SAML attribute is sent in the SAML assertion.
- Unsupported SAML attribute value is sent in the SAML assertion.
- The customer cannot be uniquely identified with the provided subject or mergeOnAttribute in the SAML assertion.
- Duplicate email address is provided in the SAML assertion.
- Unsupported element is sent in the SAML assertion.
- Element values sent in the SAML assertion do not match the corresponding Customer SSO configuration values in admin console.
- Invalid certificate found in SAML assertion.
- SAML assertion is expired.
- SAML assertion is not Base64 encoded.
- Invalid SAML entity is sent in the SAML assertion.
- Subject value is empty in the SAML assertion.
- The customer identified by the SAML assertion provided in request body, currently has 5 active web service sessions and forceLogin query parameter with value "yes" is not sent in the request.
- The customer identified by the SAML assertion provided in request body is a system created or anonymous customer.
- Invalid value of Accept-Language parameter is provided.
- There was an error during processing.

Unauthenticated Response from APIs

If SP initiated Single Sign-On is enabled, and a request made to any of the APIs results in a 401 response code (due to 'X-again-session request header is missing' or 'invalid or expired session'), the response will contain idpLoginURL, samlRequest, and providers in addition to code and developerMessage. These can be used to initiate the login process on the Identity Provider (IdP).

Note that 'idpLoginURL' and 'samlRequest' elements are retained outside the 'providers' element for backward compatibility. These will have the values of the default provider. The default provider within the 'providers' element will also have the same values.

Below is a sample 401 error response, from the APIs when SP initiated Single Sign-On is enabled: XML response

```
<?xml version="1.0" encoding="UTF-8" standalone="yes" ?><error
xmlns="http://bindings.egain.com/ws/model/v15/gen/common"> <code>401-101</code>
<developerMessage>Invalid or expired 'X-egain-session' header provided. New login is
required.</developerMessage> <idpLoginURL>https://idp_server1.com/login</idpLoginURL>
<samlRequest>PD94bWwgdmVyc2lvbj0iMS4wIiBlbmN...</samlRequest> <providers> <provider
id="186A0"> <idp>
<idpLoginURL>https://idp_server1.com/login</idpLoginURL>
<samlRequest>PD94bWwgdmVyc2lvbj0iMS4wIiBlbmN...</samlRequest> </idp>
<default>true</default> </provider> <provider id="186A1"> <idp>
<idpLoginURL>https://idp_server2.com/login</idpLoginURL>
<samlRequest>XPD94bWwgdmVyc2lv...</samlRequest> </idp>
<default>false</default> </provider> </providers></error>
```

JSON response

```
{ "code": "401-101", "developerMessage": "Invalid or expired 'X-egain-session' header
provided. New login is required.", "idpLoginURL": "https://idp_server1.com/login",

}, "default": false, "id": "186A1" } ] }
```

Auto provisioning and update of customers

Creation of new customer during SSO login

If a customer is not found in the ECE application with the *subject* provided in the SAML assertion, the application will check whether *mergeOnAttribute* SAML attribute is provided. If provided, the application uses the field specified in *mergeOnAttribute* to search for a customer. If a customer is found using *mergeOnAttribute* then this customer's information will be updated with all the customer attributes sent in the SAML Assertion and the customer identifier sent in the *subject*. If the customer is not found using *subject* and *mergeOnAttribute* both, a new customer is created in the application. The customer type will be individual.

Following customer attributes are required to be sent in the SAML attributes to create a new customer successfully:

Attribute Name	Description
department	Department name in which to lookup the customer. This must be provided only if the customer departmentalization setting is enabled in the application.
firstName	First name of the contact. Must not exceed 124 characters.

Following optional customer attributes are allowed in the SAML attributes to create a new

customer:

Attribute Name	Description
middleName	Middle name of the contact. Must not exceed 124 characters.
lastName	Last name of the contact. Must not exceed 124 characters.
dateOfBirth	Must be a date in the past. Must be in XML date format (yyyy-mm-dd).
custom.<name>	Custom attributes of the contact: "<name>" is the internal name of the custom attribute. Name must match one of the custom attributes configured in application. If the custom attribute is configured as an enumeration, the value must be one of the predefined values.
email.address	Email address of the contact. Refer Email Address definition for the valid email address format.
twitter.ID	Twitter ID of the contact. Must not exceed 255 characters.
facebook.ID	Facebook ID of the contact. Must not exceed 255 characters.
home.phone.countryCode	Country code of the home phone number of the contact. Must be a number not exceeding 9 digits.
home.phone.number	Home phone number of the contact. This accepts any string representation. It is the client's responsibility to send in the correct number. Must not exceed 25 characters.
mobile.phone.countryCode	Country code of the mobile phone number of the contact. Must be a number not exceeding 9 digits.
mobile.phone.number	Mobile phone number of the contact. This accepts any string representation. It is the client's responsibility to send in the correct number. Must not exceed 25 characters.
office.phone.countryCode	Country code of the office phone number of the contact. Must be a number not exceeding 9 digits.
office.phone.number	Office phone number of the contact. This accepts any string representation. It is the client's responsibility to send in the correct number. Must not exceed 25 characters.
mergeOnAttribute	Attribute on which existing customer records will be merged. Supported values are:

	<ul style="list-style-type: none"> • email.address • home.phone.number • mobile.phone.number • office.phone.number • custom.<name>
--	---

Modification of existing customer during SSO login

If a single customer is found in the ECE application with the *subject* provided or by using the *mergeOnAttribute* in the SAML assertion, the customer information is updated using the customer attributes in SAML attributes and the customer identifier sent in the *subject*.

Following optional customer attributes are allowed in the SAML Attributes to modify an existing customer:

Attribute Name	Description
department	Department name in which to lookup the customer. This must be provided only if the customer departmentalization setting is enabled in the application.
firstName	First name of the contact. Must not exceed 124 characters. Must be provided to create a new customer in the application.
middleName	Middle name of the contact. Must not exceed 124 characters.
lastName	Last name of the contact. Must not exceed 124 characters.
dateOfBirth	Must be a date in the past. Must be in XML date format (yyyy-mm-dd).
custom.<name>	Custom attributes of the contact: "<name>" is the internal name of the custom attribute. Name must match one of the custom attributes configured in application. If the custom attribute is configured as an enumeration, the value must be one of the predefined values.
email.address	Email address of the contact. Refer Email Address definition for the valid email address format.
twitter.ID	Twitter ID of the contact. Must not exceed 255 characters.
facebook.ID	Facebook ID of the contact. Must not exceed 255 characters.
home.phone.countryCode	Country code of the home phone number of the contact. Must be a number not exceeding 9 digits.
home.phone.number	Home phone number of the contact. This accepts any string representation. It is the

	client's responsibility to send in the correct number. Must not exceed 25 characters.
mobile.phone.countryCode	Country code of the mobile phone number of the contact. Must be a number not exceeding 9 digits.
mobile.phone.number	Mobile phone number of the contact. This accepts any string representation. It is the client's responsibility to send in the correct number. Must not exceed 25 characters.
office.phone.countryCode	Country code of the office phone number of the contact. Must be a number not exceeding 9 digits.
office.phone.number	Office phone number of the contact. This accepts any string representation. It is the client's responsibility to send in the correct number. Must not exceed 25 characters.
mergeOnAttribute	Attribute on which existing customer records will be merged. Supported values are: <ul style="list-style-type: none"> • email.address • home.phone.number • mobile.phone.number • office.phone.number • custom.<name>

DeleteCustomerGrantExamples Class Reference

Detailed Description

Examples for delete grants provided by a customer

Example 1 - Delete multiple grants of a customer

This example demonstrates the following:

- Deleting grants provided to multiple customers (2 customers in this example).

XML

Request

Method	URL
DELETE	/ws/v12/interaction/customer/1000/grant

Request headers

Name	Value
X-egain-session	Valid session ID
Accept	application/xml
Content-Type	application/xml
Accept-Language	en-US

Request body

```
<?xml version="1.0" encoding="UTF-8" standalone="yes" ?><grants
xmlns="http://bindings.egain.com/ws/model/v12/gen/interaction/customer">  <grantsTo>
<customer id="1001"/>      <customer id="1020"/>  </grantsTo></grants>
```

Response

HTTP/1.1 204 No Content

Response headers

Name	Value
X-egain-session	current session ID
Content-Type	application/xml

JSON

Request

Method	URL
DELETE	/ws/v12/interaction/customer

	/1000/grant
--	-------------

Request headers

Name	Value
X-egain-session	Valid session ID
Accept	application/json
Content-Type	application/json
Accept-Language	en-US

Request body

```
{  "grantsTo": {    "customer": [      {        "id": "1001"      }    ],    "id": "1020"  } }
```

Response

HTTP/1.1 204 No Content

Response headers

X-egain-session	current session ID
Content-Type	application/json

DeleteCustomerGrantPage Class Reference

Detailed Description

Delete customer grants

Overview

This API allows the user to delete one or more grants provided by a customer. Refer [Customer grants](#) for information about what is a grant.

Since:

11.6

APIs

Method	URL	Description
DELETE	/ws/v12/interaction/customer/{ID}/grant	Deletes grants on the customer specified through {ID}.

Authentication

Authentication is required. The client must be logged in to call this API. Each API request must contain X-again-session request header returned by Login API.

Permissions

All of the following are required:

- User must have 'Edit Customer' action.
- If "Customer departmentalization" setting is enabled in the application, then all customers (granted on and granted to) must belong to either the user's home department, or to a department where the user is a foreign user.

Licenses

The logged in user must have the following licenses:

- ECE CIH Platform

Request

Request headers

Name	Description	Allowed values	Default value
------	-------------	----------------	---------------

X-egain-session	Session ID obtained from Login API response header	N/A	N/A
Accept	Content type accepted by client.	application/xml or application/json	N/A
Content-Type	Media type sent by the client	application/xml or application/json	N/A
Accept-Language	Language locale accepted by client (used for locale specific fields in resource representation and in error responses)	Supported 'Accept-Language' header codes	default system language

Request Body

The request body is mandatory. Request body can be in either XML or JSON format:

Elements required in request body

Name	Description
grantsTo.customer.id	The customers whose grants have to be deleted.

Optional elements allowed in request body

None

Request body XML schemas:

- [Grants Schema](#)

Supported API specific query parameters

None

Supported common query parameters

None

Response

Response headers

Name	Description	Possible values
X-egain-session	Session ID of the current user session	N/A
Content-Type	Media type of response body	application/xml or application/json

Response body XML schemas:

- [Error](#) - used in case of error

HTTP status codes

Success Status codes

204 - No Content

- The request was successfully executed.

Failure Status codes

400 - Bad Request

- Any query parameter is sent in the request.
- Request body does not contain the required elements.
- An unsupported element is present in the request body.
- Elements provided do not adhere to the rules stated in the [Request Body](#) section.
- Request body is empty.
- Any of the grants do not exist

401 - Unauthorized

- X-egain-session request header is missing.
- Session is invalid or expired.

403 - Forbidden

- The user does not have sufficient permissions. Refer [Permissions](#) section for details.

406 - Not Acceptable

- Invalid 'Accept-Language' header value

500 - Internal server error

Examples:

[Example 1 - Delete multiple grants of a customer](#)

Name	Description	Type
id	ID of the department	Long
name	Name of the department	String
link	Self link to the department resource	Link

Member Function Documentation

long [getId](#) ()

Gets the value of the id property.

Returns:

possible object is [Long](#)

[Link](#) [getLink](#) ()

Gets the value of the link property.

Returns:

possible object is [Link](#)

java.lang.String [getName](#) ()

Gets the value of the name property.

Returns:

possible object is [java.lang.String](#)

void setId (long value)

Sets the value of the id property.

Parameters:

<i>value</i>	allowed object is Long
--------------	--

void setLink ([Link](#) value)

Sets the value of the link property.

Parameters:

<i>value</i>	allowed object is Link
--------------	--

void setName (java.lang.String value)

Sets the value of the name property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

Detailed Description

Documentation to be added when the Authoring API is released.

Member Function Documentation

long [getId](#) ()

Gets the value of the id property.

[Link](#) [getLink](#) ()

Gets the value of the link property.

Returns:

possible object is [Link](#)

java.lang.String [getName](#) ()

Gets the value of the name property.

Returns:

possible object is [java.lang.String](#)

void [setId](#) (long *value*)

Sets the value of the id property.

void [setLink](#) ([Link](#) *value*)

Sets the value of the link property.

Parameters:

<i>value</i>	allowed object is Link
--------------	--

void [setName](#) (java.lang.String *value*)

Sets the value of the name property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

Detailed Description

Deployment Schema

This schema contains information about the Customer Website [Deployment](#).

XML Schema File

model/v3/xsd/common.xsd

Name	Description	Type
eGainSecure	Indicates if the customer website deployment is secure (uses HTTPS) or not (uses HTTP).	boolean
spAuthenticationEnabled	Indicates if Service provider initiated authentication is enabled	boolean
samlToken	SAML Token for Single Sign On.	string
samlRequest	SAML Request Token for Single Sign On.	string
idpURL	Identity Provider URL for Single Sign On.	string
idpLoginURL	Identity Provider Login URL for Single Sign On.	string
idpLogoutURL	Identity Provider Logout URL	string

	for Single Sign On.	
providers	Details of all configured providers in the application.	Providers

Member Function Documentation

java.lang.String getIdpLoginURL ()

Gets the value of the idpLoginURL property.

Returns:

possible object is [java.lang.String](#)

java.lang.String getIdpLogoutURL ()

Gets the value of the idpLogoutURL property.

Returns:

possible object is [java.lang.String](#)

java.lang.String getIdpURL ()

Gets the value of the idpURL property.

Returns:

possible object is [java.lang.String](#)

[Providers](#) getProviders ()

Gets the value of the providers property.

Returns:

possible object is [Providers](#)

java.lang.String getRelayState ()

Gets the value of the relayState property.

Returns:

possible object is [java.lang.String](#)

java.lang.String getSamlRequest ()

Gets the value of the samlRequest property.

Returns:

possible object is [java.lang.String](#)

java.lang.String getSamlToken ()

Gets the value of the samlToken property.

Returns:

possible object is [java.lang.String](#)

boolean isEGainSecure ()

Gets the value of the eGainSecure property.

boolean isSpAuthenticationEnabled ()

Gets the value of the spAuthenticationEnabled property.

void setEGainSecure (boolean *value*)

Sets the value of the eGainSecure property.

void setIdpLoginURL (java.lang.String *value*)

Sets the value of the idpLoginURL property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setIdpLogoutURL (java.lang.String *value*)

Sets the value of the idpLogoutURL property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setIdpURL (java.lang.String *value*)

Sets the value of the idpURL property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setProviders ([Providers](#) *value*)

Sets the value of the providers property.

Parameters:

<i>value</i>	allowed object is Providers
--------------	---

void setRelayState (java.lang.String *value*)

Sets the value of the relayState property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setSamlRequest (java.lang.String *value*)

Sets the value of the samlRequest property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setSamlToken (java.lang.String *value*)

Sets the value of the samlToken property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setSpAuthenticationEnabled (boolean *value*)

Sets the value of the spAuthenticationEnabled property.

EditActivityExamples Class Reference

Detailed Description

Examples of Edit Activity

Example 1 - Modify all allowed attributes of an activity

This example demonstrates the following:

- Editing all allowed attributes of an activity.

XML

Request

Method	URL
PUT	/ws/v12/interaction/activity

Request headers

Name	Value
X-egain-session	Valid session ID
Accept	application/xml
Content-Type	application/xml
Accept-Language	en-US

Request body:

```
<activitiesxmlns="http://bindings.egain.com/ws/model/v12/gen/interaction/activity"xmlns:ns2="http://bindings.egain.com/ws/model/v12/gen/common">  <activity id="1000">    <lastModified date="2015-12-28T13:38:50.000Z" />    <dueDate>2020-11-30T18:30:00.000Z</dueDate>    <priority>5</priority>    <customAttributes>      <ns2:customAttribute>        <ns2:attribName>customer_rating</ns2:attribName>        <ns2:attribValues>          <ns2:attribValue>            <ns2:value>5</ns2:value>          </ns2:attribValue>        </ns2:attribValues>      </ns2:customAttribute>    </customAttributes>  </activity></activities>
```

Response:

HTTP/1.1 204 No Content

Response headers

Name	Value
X-egain-session	current session ID
Content-Type	application/xml

JSON

Request

Method	URL
PUT	/ws/v12/interaction/activity

Request headers

Name	Value
X-egain-session	Valid session ID
Accept	application/json
Content-Type	application/json
Accept-Language	en-US

Request body:

```
{
  "activity": [
    {
      "id": "1000",
      "lastModified": {
        "date": "2015-12-28T13:38:50.000Z",
        "dueDate": "2020-11-30T18:30:00.000Z",
        "priority": "5",
        "customAttributes": {
          "customAttribute": [
            {
              "attribName": "customer_rating",
              "attribValues": {
                "value": "5"
              }
            }
          ]
        }
      }
    }
  ]
}
```

Response:

HTTP/1.1 204 No Content

Response headers

Name	Value
X-egain-session	current session ID
Content-Type	application/json

Example 2 - Modify activity to remove attribute values

This example demonstrates the following:

- Removing the existing values of a few attributes. This example removes the values of a custom attribute, priority, and due date of the activity.

XML

Request

Method	URL
PUT	/ws/v12/interaction/activity

Request headers

Name	Value
X-egain-session	Valid session ID
Accept	application/xml
Content-Type	application/xml
Accept-Language	en-US

Request body:

```
<activitiesxmlns="http://bindings.egain.com/ws/model/v12/gen/interaction/activity"xmlns:ns2="http://bindings.egain.com/ws/model/v12/gen/common">  <activity id="1000">    <lastModified date="2015-12-30T07:38:15.000Z" />    <dueDate/>    <priority/>    <customAttributes>    <ns2:customAttribute>      <ns2:attribName>customer_rating</ns2:attribName>      <ns2:attribValues>        <ns2:attribValue>          <ns2:value/>        </ns2:attribValue>      </ns2:attribValues>    </ns2:customAttribute>  </customAttributes>  </activity></activities>
```

Response:

HTTP/1.1 204 No Content

Response headers

Name	Value
X-egain-session	current session ID
Content-Type	application/xml

JSON

Request

Method	URL
PUT	/ws/v12/interaction/activity

Request headers

Name	Value
X-egain-session	Valid session ID
Accept	application/json
Content-Type	application/json
Accept-Language	en-US

Request body:

```
{  "activity": [    {      "id": "1000",      "lastModified": {        "date": "2015-12-30T07:38:15.000Z",        "dueDate": "",        "priority": ""      },      "customAttributes": {        "customAttribute": [          {            "attribName": "customer_rating",            "attribValue": [              {                "value": ""              }            ]          }        ]      }    }  ]}
```

Response:

HTTP/1.1 204 No Content

Response headers

Name	Value
X-egain-session	current session ID
Content-Type	application/json

EditActivityPage Class Reference

Detailed Description

Edit Activity

Overview

This API allows user to modify the dueDate, priority and the custom attributes of an activity. Only one activity can be modified at a time. This API is applicable for all activity types.

For this API to execute successfully:

- An activity with the ID specified in the request body must exist.
- The status of the specified activity must be 'assigned'.
- Activity must be assigned to the logged in user.
- At least one of the attributes apart from mandatory attributes must be provided.

Since:

11.6

APIs

Method	URL	Description
PUT	/ws/v12/interaction/activity	Modify an existing activity.

Authentication

Authentication is required. The client must be logged in to call this API. Each API request must contain X-again-session request header returned by Login API.

Permissions

All of the following are required:

- User must have 'Edit Activity' action.
- The activity must either belong to the user's home department, or to a department in which the user is a foreign user.

Licenses

The logged in user must have the following licenses:

- ECE Mail license for an email activity.
- ECE Chat license for a chat activity.

Request

Request headers

Name	Description	Allowed values	Default value
X-egain-session	Session ID obtained from Login API response header	N/A	N/A
Accept	Content type accepted by client.	application/xml or application/json	N/A
Content-Type	Media type sent by the client	application/xml or application/json	N/A
Accept-Language	Language locale accepted by client (used for locale specific fields in resource representation and in error responses)	Supported 'Accept-Language' header codes	default system language

Request Body

The request body is mandatory. Request body can be in either XML or JSON format.

Elements required in the request body

Name	Description
id	ID of the Activity.
lastModified.date	Value of last Modified date of the activity.

Optional elements allowed in the request body

Name	Description
dueDate	If provided, must be a future date. Refer supported date format here .
priority	Must be a value between 1 and 7.
customAttributes	Name must match one of the custom attributes configured in application. If the custom attribute is configured as an enumeration, the value must be one of the predefined values.

NOTE: To remove value of any element of type "String", "integer" or "dateTime", set the value to an empty string (instead of setting the value to null).

Request body XML schemas:

- [Activity Schema](#)

Supported API specific query parameters

None

Supported common query parameters

None

Response

Response headers

Name	Description	Possible values
X-egain-session	ID of the current user session	N/A
Content-Type	Media type of response body	application/xml or application/json

Response body XML schemas:

- [Error](#) - used in case of error

HTTP status codes

Success Status codes

204 - No Content

- Successfully modified the activity.

Failure Status codes

400 - Bad Request

- Any query parameter is sent in the request.
- Request body does not contain the required elements.
- Unsupported element is present in the request body.
- Any criteria for successful execution mentioned in the [Overview](#) or [Request Body](#) sections are violated.
- Request body is empty.

401 - Unauthorized

- X-egain-session request header is missing.
- Session is invalid or expired.

403 - Forbidden

- If the user does not have the appropriate permissions for this operation. Refer the [Permissions](#) section.

406 - Not Acceptable

- Invalid 'Accept-Language' header value.

409 - Conflict

- The lastModified date of the activity in the request does not match its lastModified date on the server.

500 - Internal server error

Examples:

[Example 1 - Modify all allowed attributes of an activity](#)

[Example 2 - Modify activity to remove attribute values](#)

EditCasePage Class Reference

Detailed Description

Edit Case

Overview

This API allows user to modify an existing case. Only one case can be modified at a time.

For this API to execute successfully:

- A case with the ID specified in the request body must exist.
- The status of the specified case must be 'open'.
- At least one attribute of the case must be provided in the request body modification.
- If the case is being assigned to a user other than the logged in user:
 - The target user must not be disabled.
 - The target user must have the ECE CIH Platform license.

Since:

11.6

APIs

Method	URL	Description
PUT	/ws/v12/interaction/ case	Modify an existing case

Authentication

Authentication is required. The client must be logged in to call this API. Each API request must contain X-again-session request header returned by Login API.

Permissions

- User must have 'Edit Case' action.
- The case must either belong to the user's home department, or to a department in which the user is a foreign user.
- If the case is being assigned to a user other than the logged in user:
 - The logged in user must have 'Transfer Activities' permission on the target user.
 - Case must either belong to the home department of the target user, or to a department in which the target user is a foreign user.
-
- If the current case owner is different than the logged in user, logged in user must have "Pull Activities" permission on the case owner.

Licenses

The logged in user must have the following licenses:

- ECE CIH Platform

Request

Request headers

Name	Description	Allowed values	Default value
X-egain-session	Session ID obtained from Login API response header	N/A	N/A
Accept	Content type accepted by client.	application/xml or application/json	N/A
Content-Type	Media type sent by the client	application/xml or application/json	N/A
Accept-Language	Language locale accepted by client (used for locale specific fields in resource representation and in error responses)	Supported 'Accept-Language' header codes	default system language

Request Body

The request body is mandatory. Request body can be in either XML or JSON format.

Elements required in request body

Name	Description
id	ID of the Case.
lastModified.date	Value of last Modified date of the case.

Optional elements allowed in request body

Name	Description
dueDate	If provided, must be a future date. Refer supported date format here . If value is not provided, the due date for the case is removed.
owner.user.id	Must be an ID of a user in the application.
severity.value	Must be one of 'urgent', 'high', 'medium', or 'low'.

subject	Must not exceed 1024 characters.
description	Must not exceed 1024 characters.
solution	Must not exceed 1024 characters.
customAttributes	Name must match one of the custom attributes configured in application. If the custom attribute is configured as an enumeration, the value must be one of the predefined values.

NOTE: To remove value of any element of type "String", set the value to an empty string (instead of setting the value to null).

Detailed Description

Edit Contact Point

Overview

This section contains the required and optional elements to edit an existing contact point.

Email contact point

Elements required in request body

Name	Description
id	ID of the contact point.

Optional elements allowed in request body

Name	Description
type.email.emailAddress	Must be a valid email address or phone number. Refer Email Address definition for the valid email address format. "Customer departmentalization" setting is enabled in the application, the provided email address must not be associated with any existing contact points in the same department. "Customer departmentalization" setting is disabled in application, the provided email address must not be associated with any existing contact points in the application.
priority.value	Must be 'low', 'medium', or 'high'.
customAttributes	Name must match one of the custom attributes configured in application. If the custom attribute is configured as an enumeration, the value must be one of the predefined values.

Phone contact point

Elements required in request body

Name	Description
id	ID of the contact point.

Optional elements allowed in request body

Name	Description
type.phone.type.value	This can be one of 'home', 'office', 'mobile', 'fax', or 'pager'.
type.phone.phoneNo	This accepts any string representation. It is the client's responsibility to send in the correct number. Must not exceed 40 characters.
type.phone.countryCode	Must be a number not exceeding 9 digits.
type.phone.areaCode	Must not exceed 10 characters.
type.phone.extension	Must not exceed 10 characters.
type.phone.availability.days.value	Must be one of weekdays, weekends, and 'any_day'.
type.phone.availability.times.value	Must be one of 'mornings', 'afternoons', 'evenings', 'day', and 'anytime'.
priority.value	Must be 'low', 'medium', or 'high'.
customAttributes	Name must match one of the custom attributes configured in application. If the custom attribute is configured as an enumeration, the value must be one of the predefined values.

Postal contact point

Elements required in request body

Name	Description
id	ID of the contact point.

Optional elements allowed in request body

Name	Description
type.postal.type.value	Must be one of 'office', 'home', 'mailto', 'billto', or 'shipto'.
type.postal.address_1	Must not exceed 50 characters.
type.postal.address_2	Must not exceed 50 characters.
type.postal.city	Must not exceed 50 characters.
type.postal.state	Must not exceed 50 characters.
type.postal.zip	Must not exceed 50 characters.
type.postal.country	Must not exceed 50 characters.
type.postal.region	Must not exceed 50 characters.
priority.value	Must be 'low', 'medium', or 'high'.
customAttributes	Name must match one of the custom attributes configured in application. If the

	custom attribute is configured as an enumeration, the value must be one of the predefined values.
--	---

Web contact point

Elements required in request body

Name	Description
id	ID of the contact point.

Optional elements allowed in request body

Name	Description
type.website.url	Must not exceed 1024 characters.
priority.value	Must be 'low', 'medium', or 'high'.
customAttributes	Name must match one of the custom attributes configured in application. If the custom attribute is configured as an enumeration, the value must be one of the predefined values.

Social contact point

Elements required in request body

Name	Description
id	ID of the contact point.

Optional elements allowed in request body

Name	Description
type.social.type.value	Must be one of 'twitter', 'facebook', 'community', or 'other'.
type.socialId	Must not exceed 255 characters.
priority.value	Must be 'low', 'medium', or 'high'.
customAttributes	Name must match one of the custom attributes configured in application. If the custom attribute is configured as an enumeration, the value must be one of the predefined values.

EditCorporateCustomerPage Class Reference

Detailed Description

Edit Corporate Customer

Overview

This API allows user to modify an existing corporate customer.

This API also allows user to:

- Modify the existing contact persons and contact points of the customer.
- Add new contact persons and contact points for the customer.

Since:

11.6

APIs

Method	URL	Description
PUT	/ws/v12/interaction/customer	Modify an existing corporate customer.

Authentication

Authentication is required. The client must be logged in to call this API. Each API request must contain X-again-session request header returned by Login API.

Permissions

All of the following are required:

- User must have 'Edit Customer' action.
- If "Customer departmentalization" setting is enabled in the application, then the customer being modified must belong to either the user's home department, or to the department where the user is a foreign user.
- If preferred agent of the customer has to be modified:
 - User must have view permission on the target preferred agent.
 - If "Customer departmentalization" setting is enabled in the application, the department of the customer must either be the home department of the target preferred agent or the target preferred agent must be a foreign user in the customer's department.

Licenses

The logged in user must have the following licenses:

- ECE CIH Platform

Request

Request headers

Name	Description	Allowed values	Default value
X-egain-session	Session ID obtained from Login API response header	N/A	N/A
Accept	Content type accepted by client.	application/xml or application/json	N/A
Content-Type	Media type sent by the client	application/xml or application/json	N/A
Accept-Language	Language locale accepted by client (used for locale specific fields in resource representation and in error responses)	Supported 'Accept-Language' header codes	default system language

Request Body

The request body is mandatory. Request body can be in either XML or JSON format:

Elements required in request body

Name	Description
id	ID of the customer.

Optional elements allowed in request body

Name	Description
customerName	Must not exceed 124 characters.
type.group.type.value	Must be one of the values configured in application.
level.value	Must be one of the values configured in application.
role.value	Must be one of 'Partner', 'Reseller' or 'Customer'.
pin	Must not exceed 255 characters.
howReferred.value	Must be one of 'Website', 'Customer', 'Partner', 'Employee' or 'Reseller'.
industry.value	Must be one of the values configured in application.

marketSegment	Must not exceed 50 characters.
preferredAgent.id	Must match the ID of a user in application.
entitlements	Must not exceed 1024 characters.
type.corporate.region	Must be one of the values configured in application.
type.corporate.numberOfEmployees	Must not exceed 19 digits.
type.corporate.revenues	Must not exceed 20 characters.
type.corporate.currency	Must not exceed 255 characters.
type.corporate.registrationNumber	Must not exceed 255 characters.
type.corporate.sector	Must not exceed 50 characters.
contactPersons.contactPerson	<p>Can have multiple contact persons.</p> <ul style="list-style-type: none"> For required and optional values to add a new contact person, refer Create Contact Person. For required and optional elements to edit an existing contact person, refer Edit Contact Person.
customAttributes	Name must match one of the custom attributes configured in application. If the custom attribute is configured as an enumeration, the value must be one of the predefined values.

NOTE: To remove value of any element of type "String", set the value to an empty string.

Request body XML schemas:

- [Customers Schema](#)

Supported API specific query parameters

None

Supported common query parameters

None

Response

Response headers

Name	Description	Possible values
X-egain-session	ID of the current user session	N/A
Content-Type	Media type of response body	application/xml or application/json

Response body

The response body will be sent only in case of error. It can be in either XML or JSON format.

Response body XML schemas:

- [Error](#) - used in case of error

HTTP status codes

Success Status codes

204 - No Content

- Successfully modified the customer.

Failure Status codes

400 - Bad Request

- Any query parameter is sent in the request.
- Request body does not contain the required elements.
- Unsupported element is present in the request body.
- Any criteria for successful execution mentioned in the [Request Body](#) section is violated.

401 - Unauthorized

- X-egain-session request header is missing.
- Session is invalid or expired.

403 - Forbidden

- The user does not have sufficient permissions. Refer [Permissions](#) section for details.

406 - Not Acceptable

- Invalid 'Accept-Language' header value.

500 - Internal server error

Examples:

[Example 1 - Edit customer attributes of a corporate customer](#)

[Example 2 - Edit existing contact person for the customer](#)

[Example 3 - Add new contact person for the customer](#)

[Example 4 - Add and edit contact points for the customer](#)

EditCustomerProfileExamples Class Reference

Detailed Description

Examples for Edit Customer profile

Example 1 - Edit profile by changing a single attribute

This example demonstrates the following:

- Editing the customer profile by changing a single attribute. In this example, the last name of the customer is changed.

XML

Request

Method	URL
PUT	/ws/v15/context/interaction/customer

Request headers

Name	Value
X-egain-session	Valid session ID
Accept	application/xml
Content-Type	application/xml
Accept-Language	en-US

Request body

```

</contacts></customer>
```

Response

HTTP/1.1 204 No Content

Response headers

Name	Value
X-egain-session	current session ID
Content-Type	application/xml

JSON

Request

Method	URL
PUT	/ws/v15/context/interaction/customer

Request headers

Name	Value
X-egain-session	Valid session ID
Accept	application/json
Content-Type	application/json
Accept-Language	en-US

Request body

```
{  "contacts": {      "contact": [          {              "lastName": "Tuffey"          }      ]  }
```

Response

HTTP/1.1 204 No Content

Response headers

Name	Value
X-egain-session	current session ID
Content-Type	application/json

Example 2 - Edit profile by changing all supported attributes, adding new contact points and changing existing contact point values

This example demonstrates the following:

- Editing all supported attributes of the contact person.
- Creating new contact points. One of each type of contact point is created.
- Editing existing contact point values. One of each type of contact point is modified.

EditCustomerProfilePage Class Reference

Detailed Description

Edit customer profile

Overview

This API allows logged in customer to do the following:

- Edit profile for self.
- Add new contact points, like email, phone, etc for self.
- Modify the existing contact points for self.

Note: Deletion of existing contact points is not allowed.

Since:

11.6

APIs

Method	URL	Description
POST	/ws/v15/context/interaction/customer	Modify the profile of the logged in person.

Authentication

Authentication is required. The customer must be logged in to call this API. Each API request must contain X-egain-session request header returned by Login API.

Permissions

- All authenticated customers can access this API.

Request

Request headers

Name	Description	Allowed values	Default value
X-egain-session	Session ID obtained from Login API response header	N/A	N/A
Accept	Content type accepted by client	application/xml or application/j	N/A

		son	
Accept-Language	Language locale accepted by client (used for locale specific fields in resource representation and in error responses)	Supported 'Accept-Language' header codes	default system language

Request Body

The request body is mandatory. Request body can be in either XML or JSON format.

Elements required in request body

Name	Description
contacts.contact	This will have the details to be edited. At least one of the child attribute must be present. For required and optional elements of contact person, refer Editable Attributes of a Contact .

Supported API specific query parameters

None

Supported common query parameters

None

Response

Response headers

Name	Description	Possible values
X-egain-session	Session ID of the current user session	N/A
Content-Type	Media type of response body	application/xml or application/json

Response Body

The response body will be sent only in case of error. It can be in either XML or JSON format.

Response body xml schemas:

- [Error](#) - used in case of error

HTTP status codes

Success Status codes

204 - No Content

- The request was successfully executed.

Failure Status codes

400 - Bad Request

- Any query parameter is sent in the request.
- Request body does not contain the required elements.
- Unsupported element is present in the request body.
- Elements provided do not adhere to the rules stated in the Request Body section.

401 - Unauthorized

- X-egain-session request header is missing
- Session is invalid or expired

406 - Not Acceptable

- Invalid 'Accept-Language' header value

500 - Internal server error

Examples:

[Example 1 - Edit profile by changing a single attribute](#)

[Example 2 - Edit profile by changing all supported attributes, adding new contact points and changing existing contact point values](#)

EditGroupCustomerExamples Class Reference

Detailed Description

Examples for Edit Group Customer

Example 1 - Edit customer attributes of a group customer

This example demonstrates the following:

- Editing all the allowed customer attributes of a group customer.

EditGroupCustomerPage Class Reference

Detailed Description

Edit Group Customer

Overview

This API allows user to modify an existing group customer.

This API also allows user to:

- Modify the existing contact persons and contact points of the customer.
- Add new contact persons and contact points for the customer.

Since:

11.6

APIs

Method	URL	Description
PUT	/ws/v12/interaction/customer	Modify an existing group customer.

Authentication

Authentication is required. The client must be logged in to call this API. Each API request must contain X-again-session request header returned by Login API.

Permissions

All of the following are required:

- User must have 'Edit Customer' action.
- If "Customer departmentalization" setting is enabled in the application, then the customer being modified must belong to either the user's home department, or to the department where the user is a foreign user.
- If preferred agent of the customer has to be modified:
 - User must have view permission on the target preferred agent.
 - If "Customer departmentalization" setting is enabled in the application, the department of the customer must either be the home department of the target preferred agent or the target preferred agent must be a foreign user in the customer's department.

Licenses

The logged in user must have the following licenses:

- ECE CIH Platform

Request

Request headers

Name	Description	Allowed values	Default value
X-egain-session	Session ID obtained from Login API response header	N/A	N/A
Accept	Content type accepted by client.	application/xml or application/json	N/A
Content-Type	Media type sent by the client	application/xml or application/json	N/A
Accept-Language	Language locale accepted by client (used for locale specific fields in resource representation and in error responses)	Supported 'Accept-Language' header codes	default system language

Request Body

The request body is mandatory. Request body can be in either XML or JSON format:

Elements required in request body

Name	Description
id	ID of the customer.

Optional elements allowed in request body

Name	Description
customerName	Must not exceed 124 characters.
type.group.type.value	Must be one of the values configured in application.
level.value	Must be one of the values configured in application.
role.value	Must be one of 'Partner', 'Reseller' or 'Customer'.
pin	Must not exceed 255 characters.
howReferred.value	Must be one of 'Website', 'Customer', 'Partner', 'Employee' or 'Reseller'.
industry.value	Must be one of the values configured in application.

marketSegment	Must not exceed 50 characters.
preferredAgent.id	Must match the ID of a user in application.
entitlements	Must not exceed 1024 characters.
type.group.region	Must be one of the values configured in application.
type.group.numberOfMembers	Must not exceed 19 digits.
type.group.income	Must not exceed 20 characters.
type.group.currency	Must not exceed 255 characters.
type.group.registrationNumber	Must not exceed 255 characters.
type.group.sector	Must not exceed 50 characters.
contactPersons.contactPerson	Can have multiple contact persons. <ul style="list-style-type: none"> For required and optional values to add a new contact person, refer Create Contact Person. For required and optional elements to edit an existing contact person, refer Edit Contact Person.
customAttributes	Name must match one of the custom attributes configured in application. If the custom attribute is configured as an enumeration, the value must be one of the predefined values.

NOTE: To remove value of any element of type "String", set the value to an empty string.

Request body XML schemas:

- [Customers Schema](#)

Supported API specific query parameters

None

Supported common query parameters

None

Response

Response headers

Name	Description	Possible values
X-egain-session	ID of the current user session	N/A
Content-Type	Media type of response body	application/xml or application/json

Response body

The response body will be sent only in case of error. It can be in either XML or JSON format.

Response body XML schemas:

- [Error](#) - used in case of error

HTTP status codes

Success Status codes

204 - No Content

- Successfully modified the customer.

Failure Status codes

400 - Bad Request

- Any query parameter is sent in the request.
- Request body does not contain the required elements.
- Unsupported element is present in the request body.
- Any criteria for successful execution mentioned in the [Request Body](#) section is violated.

401 - Unauthorized

- X-egain-session request header is missing.
- Session is invalid or expired.

403 - Forbidden

- The user does not have sufficient permissions. Refer [Permissions](#) section for details.

406 - Not Acceptable

- Invalid 'Accept-Language' header value.

500 - Internal server error

Examples:

[Example 1 - Edit customer attributes of a group customer](#)

[Example 2 - Edit existing contact person for the customer](#)

[Example 3 - Add new contact person for the customer](#)

[Example 4 - Add and edit contact points for the customer](#)

EditIndividualCustomerExamples Class Reference

Detailed Description

Examples for Edit Individual Customer

Example 1 - Edit customer attributes of an individual customer

This example demonstrates the following:

- Modifying all supported customer attributes (attributes outside the contactPerson node) of an individual customer.

XML

Request

Method	URL
PUT	/ws/v12/interaction/customer

Request headers

Name	Value
X-egain-session	Valid session ID
Accept	application/xml
Content-Type	application/xml
Accept-Language	en-US

Request body

```

Response

HTTP/1.1 204 No Content

Response headers

Name	Value
X-egain-session	current session ID
Content-Type	application/json

EditIndividualCustomerPage Class Reference

Detailed Description

Edit Individual Customer

Overview

This API allows user to modify an existing individual customer.

This API also allows user to:

- Modify the existing contact person and contact points of the customer.
- Add new contact point for the customer.

Since:

11.6

APIs

Method	URL	Description
PUT	/ws/v12/interaction/customer	Modify an existing individual customer.

Authentication

Authentication is required. The client must be logged in to call this API. Each API request must contain X-again-session request header returned by Login API.

Permissions

All of the following are required:

- User must have 'Edit Customer' action.
- If "Customer departmentalization" setting is enabled in the application, then the customer being modified must belong to either the user's home department, or to the department where the user is a foreign user.
- If preferred agent of the customer has to be modified:
 - User must have view permission on the target preferred agent.
 - If "Customer departmentalization" setting is enabled in the application, the department of the customer must either be the home department of the target preferred agent or the target preferred agent must be a foreign user in the customer's department.

Licenses

The logged in user must have the following licenses:

- ECE CIH Platform

Request

Request headers

Name	Description	Allowed values	Default value
X-egain-session	Session ID obtained from Login API response header	N/A	N/A
Accept	Content type accepted by client.	application/xml or application/json	N/A
Content-Type	Media type sent by the client	application/xml or application/json	N/A
Accept-Language	Language locale accepted by client (used for locale specific fields in resource representation and in error responses)	Supported 'Accept-Language' header codes	default system language

Request Body

The request body is mandatory. Request body can be in either XML or JSON format:

Elements required in request body

Name	Description
id	ID of the customer.

Optional elements allowed in request body

Name	Description
level.value	Must be one of the values configured in application.
role.value	Must be one of 'Partner', 'Reseller', or 'Customer'.
pin	Must not exceed 255 characters.
howReferred.value	Must be one of 'Website', 'Customer', 'Partner', 'Employee', or 'Reseller'.
industry.value	Must be one of the values configured in application.
marketSegment	Must not exceed 50 characters.
preferredAgent.id	Must match the ID of a user in application.
entitlements	Must not exceed 1024 characters.

contactPersons.contactPerson	Can have a single contact person. <ul style="list-style-type: none"> For required and optional elements to edit an existing contact person, refer Edit Contact Person.
customAttributes	Name must match one of the custom attributes configured in application. If the custom attribute is configured as an enumeration, the value must be one of the predefined values.

NOTE: To remove value of any element of type "String", set the value to an empty string.

Request body XML schemas:

- [Customers Schema](#)

Supported API specific query parameters

None

Supported common query parameters

None

Response

Response headers

Name	Description	Possible values
X-egain-session	ID of the current user session	N/A
Content-Type	Media type of response body	application/xml or application/json

Response body

The response body will be sent only in case of error. It can be in either XML or JSON format.

Response body XML schemas:

- [Error](#) - used in case of error

HTTP status codes

Success Status codes

204 - No Content

- Successfully modified the customer.

Failure Status codes

400 - Bad Request

- Any query parameter is sent in the request.
- Request body does not contain the required elements.
- Unsupported element is present in the request body.
- Any criteria for successful execution mentioned in the [Request Body](#) section is violated.

401 - Unauthorized

- X-egain-session request header is missing.
- Session is invalid or expired.

403 - Forbidden

- The user does not have sufficient permissions. Refer [Permissions](#) section for details.

406 - Not Acceptable

- Invalid 'Accept-Language' header value.

500 - Internal server error

Examples:

[Example 1 - Edit customer attributes of an individual customer](#)

[Example 2 - Edit contact person attributes of the customer](#)

[Example 3 - Add and edit contact points of the customer](#)

[Example 4 - Edit the customer by removing the values](#)

Detailed Description

Edition Schema

This schema contains information about article edition.

XML Schema File

model/v15/xsd/kb/edition.xsd

Name	Description	Type
id *	ID of the edition.	Long
alternateId *	Readable Id of the edition.	String
link	Link to this edition.	Link
name	Name of the edition.	String
publishProfile	Publish View associated with this edition.	Profile
isContentEdition	<ul style="list-style-type: none">• This element indicates that its edition is the one corresponding to the returned content.• This element can only appear under at most one <edition> element in the list of editions.• It must only be returned if article content is returned as well.• The only allowed value is 'true'.	Boolean

Note : In XML response, items marked with * are returned as XML attributes while others

are returned as XML elements.

Member Function Documentation

java.lang.String getAlternateId ()

Gets the value of the alternateId property.

Returns:

possible object is [java.lang.String](#)

long getId ()

Gets the value of the id property.

Returns:

possible object is [Long](#)

[Link](#) getLink ()

Gets the value of the link property.

Returns:

possible object is [Link](#)

java.lang.String getName ()

Gets the value of the name property.

Returns:

possible object is [java.lang.String](#)

[Profile](#) getPublishProfile ()

Gets the value of the publishProfile property.

Returns:

possible object is [Profile](#)

Boolean isIsContentEdition ()

Gets the value of the isContentEdition property.

Returns:

possible object is [Boolean](#)

void setAlternateId (java.lang.String value)

Sets the value of the alternateId property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setId (long value)

Sets the value of the id property.

Parameters:

<i>value</i>	allowed object is Long
--------------	--

void setIsContentEdition (Boolean *value*)

Sets the value of the isContentEdition property.

Parameters:

<i>value</i>	allowed object is Boolean
--------------	---

void setLink ([Link](#) *value*)

Sets the value of the link property.

Parameters:

<i>value</i>	allowed object is Link
--------------	--

void setName (java.lang.String *value*)

Sets the value of the name property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setPublishProfile ([Profile](#) *value*)

Sets the value of the publishProfile property.

Parameters:

<i>value</i>	allowed object is Profile
--------------	---

- `java.util.List<Edition> getEdition ()`
-

Detailed Description

Editions Schema

This schema contains information about article editions.

XML Schema File

`model/v15/xsd/kb/edition.xsd`

Name	Description	Type
<code>edition</code>	One or more instances of Edition .	Edition

Member Function Documentation

`java.util.List<Edition> getEdition ()`

Gets the value of the edition property.

This accessor method returns a reference to the live list, not a snapshot. Therefore any modification you make to the returned list will be present inside the JAXB object. This is why there is not a `set` method for the edition property.

For example, to add a new item, do as follows:

```
getEdition() .add(newItem);
```

Objects of the following type(s) are allowed in the list [Edition](#)

Name	Description	Type
id	ID of the requested contact point	Long
emailAddress	Email address of the contact point	String
lastModified	Last modification details of the contact point	DateAndUser

Member Function Documentation

java.lang.String getEmailAddress ()

Gets the value of the emailAddress property.

Returns:

possible object is [java.lang.String](#)

long getId ()

Gets the value of the id property.

Returns:

possible object is [Long](#)

[DateAndUser](#) getLastModified ()

Gets the value of the lastModified property.

Returns:

possible object is [DateAndUser](#)

void setEmailAddress (java.lang.String value)

Sets the value of the emailAddress property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setId (long value)

Sets the value of the id property.

Parameters:

<i>value</i>	allowed object is Long
--------------	--

void setLastModified ([DateAndUser](#) value)

Sets the value of the lastModified property.

Parameters:

<i>value</i>	allowed object is DateAndUser
--------------	---

void setEmailAddress (java.lang.String value)

Sets the value of the emailAddress property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setId (long value)

Sets the value of the id property.

Parameters:

<i>value</i>	allowed object is Long
--------------	--

void setLastModified ([DateAndUser](#) value)

Sets the value of the lastModified property.

Parameters:

<i>value</i>	allowed object is DateAndUser
--------------	---

EmailAddressDefinitionPage Class Reference

Detailed Description

Email Address

Email Address

Following must be true for any email address sent in API requests:

- Only one @ character must be present.
- At least one character must be present between @ and dot(.).
- At least one dot(.) must present after @ character.
- Dot(.) must not be the last character.
- Must not exceed 255 characters.
- Following characters must not be present:
 1. Round bracket ()
 2. Square bracket []
 3. More than one consecutive backward slash
 4. colon :
 5. semi-colon ;
 6. Space ()
 7. Angular bracket <>
 8. double quote "

Detailed Description

EmailAttributes Schema

This schema contains the definition of all email specific attributes of an email activity.

XML Schema File

model/v12/xsd/interaction/activity.xsd

Name	Description	Type
id	ID of the email.	Long
lastAction	A string specifying the last action that was performed on this activity.	LastAction
hasDraft	Boolean value specifying whether this activity has a draft.	Boolean
leaveOpen	Boolean value specifying whether this activity has to be completed or not, after sending it out of the system.	Boolean

	This is applicable only to composed activities of type email.	
isEscalated	Boolean value specifying whether this activity was created as an escalation from the selfservice portal.	Boolean
isOutboundFailed	Boolean value specifying whether this email activity was attempted to be sent out, which failed.	Boolean
alias	Alias used in this email activity.	Alias
date	The date when this email was sent to the mail server.	DateTime
sentBy	Information about the customer who sent this activity. This will be provided when a customer sent an email on behalf of another customer from the message center	SentBy
contents	This has the contents of the email. This can have multiple 'Content' elements.	Contents
emailAddresses	This has the email addresses of this email activity.	String
header	This contains the email header.	String

Member Function Documentation

[Alias](#) getAlias ()

Gets the value of the alias property.

Returns:

possible object is [Alias](#)

[Contents](#) getContents ()

Gets the value of the contents property.

Returns:

possible object is [Contents](#)

[DateAndTime](#) getDate ()

Gets the value of the date property.

Returns:

possible object is [DateAndTime](#)

[AllEmailAddresses](#) getEmailAddresses ()

Gets the value of the emailAddresses property.

Returns:

possible object is [AllEmailAddresses](#)

java.lang.String getHeader ()

Gets the value of the header property.

Returns:

possible object is [java.lang.String](#)

long getId ()

Gets the value of the id property.

Returns:

possible object is [Long](#)

[LastAction](#) getLastAction ()

Gets the value of the lastAction property.

Returns:

possible object is [LastAction](#)

[SentBy](#) getSentBy ()

Gets the value of the sentBy property.

Returns:

possible object is [SentBy](#)

Boolean isHasDraft ()

Gets the value of the hasDraft property.

Returns:

possible object is [Boolean](#)

Boolean isIsEscalated ()

Gets the value of the isEscalated property.

Returns:

possible object is [Boolean](#)

Boolean isIsOutboundFailed ()

Gets the value of the isOutboundFailed property.

Returns:

possible object is [Boolean](#)

Boolean isLeaveOpen ()

Gets the value of the leaveOpen property.

Returns:

possible object is [Boolean](#)

void setAlias ([Alias](#) value)

Sets the value of the alias property.

Parameters:

<i>value</i>	allowed object is Alias
--------------	---

void setContents ([Contents](#) value)

Sets the value of the contents property.

Parameters:

<i>value</i>	allowed object is Contents
--------------	--

void setDate ([DateAndTime](#) value)

Sets the value of the date property.

Parameters:

<i>value</i>	allowed object is DateAndTime
--------------	---

void setEmailAddresses ([AllEmailAddresses](#) value)

Sets the value of the emailAddresses property.

Parameters:

<i>value</i>	allowed object is AllEmailAddresses
--------------	---

void setHasDraft (Boolean value)

Sets the value of the hasDraft property.

Parameters:

<i>value</i>	allowed object is Boolean
--------------	---

void setHeader (java.lang.String value)

Sets the value of the header property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setId (long value)

Sets the value of the id property.

Parameters:

<i>value</i>	allowed object is Long
--------------	--

void setIsEscalated (Boolean value)

Sets the value of the isEscalated property.

Parameters:

<i>value</i>	allowed object is Boolean
--------------	---

void setIsOutboundFailed (Boolean *value*)

Sets the value of the isOutboundFailed property.

Parameters:

<i>value</i>	allowed object is Boolean
--------------	---

void setLastAction ([LastAction](#) *value*)

Sets the value of the lastAction property.

Parameters:

<i>value</i>	allowed object is LastAction
--------------	--

void setLeaveOpen (Boolean *value*)

Sets the value of the leaveOpen property.

Parameters:

<i>value</i>	allowed object is Boolean
--------------	---

void setSentBy ([SentBy](#) *value*)

Sets the value of the sentBy property.

Parameters:

<i>value</i>	allowed object is SentBy
--------------	--

Member Function Documentation

[Alias](#) getAlias ()

Gets the value of the alias property.

Returns:

possible object is [Alias](#)

[Contents](#) getContents ()

Gets the value of the contents property.

Returns:

possible object is [Contents](#)

[DateAndTime](#) getDate ()

Gets the value of the date property.

Returns:

possible object is [DateAndTime](#)

[AllEmailAddresses](#) getEmailAddresses ()

Gets the value of the emailAddresses property.

Returns:

possible object is [AllEmailAddresses](#)

java.lang.String getHeader ()

Gets the value of the header property.

Returns:

possible object is [java.lang.String](#)

long getId ()

Gets the value of the id property.

Returns:

possible object is [Long](#)

[LastAction](#) getLastAction ()

Gets the value of the lastAction property.

Returns:

possible object is [LastAction](#)

[MessageCenter](#) getMessageCenter ()

Gets the value of the messageCenter property.

Returns:

possible object is [MessageCenter](#)

[SentBy](#) getSentBy ()

Gets the value of the sentBy property.

Returns:

possible object is [SentBy](#)

[User](#) getSentTo ()

Gets the value of the sentTo property.

Returns:

possible object is [User](#)

Boolean isHasDraft ()

Gets the value of the hasDraft property.

Returns:

possible object is [Boolean](#)

Boolean isEscalated ()

Gets the value of the isEscalated property.

Returns:

possible object is [Boolean](#)

Boolean isOutboundFailed ()

Gets the value of the isOutboundFailed property.

Returns:

possible object is [Boolean](#)

Boolean isLeaveOpen ()

Gets the value of the leaveOpen property.

Returns:

possible object is [Boolean](#)

void setAlias ([Alias](#) value)

Sets the value of the alias property.

Parameters:

<i>value</i>	allowed object is Alias
--------------	---

void setContents ([Contents](#) value)

Sets the value of the contents property.

Parameters:

<i>value</i>	allowed object is Contents
--------------	--

void setDate ([DateAndTime](#) value)

Sets the value of the date property.

Parameters:

<i>value</i>	allowed object is DateAndTime
--------------	---

void setEmailAddresses ([AllEmailAddresses](#) value)

Sets the value of the emailAddresses property.

Parameters:

<i>value</i>	allowed object is AllEmailAddresses
--------------	---

void setHasDraft (Boolean value)

Sets the value of the hasDraft property.

Parameters:

<i>value</i>	allowed object is Boolean
--------------	---

void setHeader (java.lang.String value)

Sets the value of the header property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setId (long value)

Sets the value of the id property.

Parameters:

<i>value</i>	allowed object is Long
--------------	--

void setIsEscalated (Boolean value)

Sets the value of the isEscalated property.

Parameters:

<i>value</i>	allowed object is Boolean
--------------	---

void setIsOutboundFailed (Boolean value)

Sets the value of the isOutboundFailed property.

Parameters:

<i>value</i>	allowed object is Boolean
--------------	---

void setLastAction ([LastAction](#) value)

Sets the value of the lastAction property.

Parameters:

<i>value</i>	allowed object is LastAction
--------------	--

void setLeaveOpen (Boolean value)

Sets the value of the leaveOpen property.

Parameters:

<i>value</i>	allowed object is Boolean
--------------	---

void setMessageCenter ([MessageCenter](#) value)

Sets the value of the messageCenter property.

Parameters:

<i>value</i>	allowed object is MessageCenter
--------------	---

void setSentBy ([SentBy](#) value)

Sets the value of the sentBy property.

Parameters:

<i>value</i>	allowed object is SentBy
--------------	--

void setSentTo ([User](#) value)

Sets the value of the sentTo property.

Parameters:

<i>value</i>	allowed object is User
--------------	--

Detailed Description

EntryPoint Schema

This schema has the definition of a chat [EntryPoint](#).

XML Schema File

model/v15/xsd/live/entrypoint.xsd

Name	Description	Type
id	ID of the entry point.	Long
name	Name of the entry point.	String
link	Link to the entry point.	Link

Member Function Documentation

long getId ()

Gets the value of the id property.

Returns:

possible object is [Long](#)

[Link](#) getLink ()

Gets the value of the link property.

Returns:

possible object is [Link](#)

java.lang.String getName ()

Gets the value of the name property.

Returns:

possible object is [java.lang.String](#)

void setId (long *value*)

Sets the value of the id property.

Parameters:

<i>value</i>	allowed object is Long
--------------	--

void setLink ([Link](#) *value*)

Sets the value of the link property.

Parameters:

<i>value</i>	allowed object is Link
--------------	--

void setName (java.lang.String *value*)

Sets the value of the name property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

Detailed Description

Java class for [EntryPoints](#) complex type.

The following schema fragment specifies the expected content contained within this class.

```
<complexType name="EntryPoints"> <complexContent> <restriction
base="{http://www.w3.org/2001/XMLSchema}anyType"> <sequence> <element name="link"
type="{http://bindings.egain.com/ws/model/v15/gen/common}Link" minOccurs="0"/> <element
name="entryPoint" type="{http://bindings.egain.com/ws/model/v15/gen/live/entrypoint}EntryPoint"
maxOccurs="unbounded" minOccurs="0"/> <element name="paginationInfo"
type="{http://bindings.egain.com/ws/model/v15/gen/common}PaginationInfo" minOccurs="0"/>
</sequence> <attribute name="count" type="{http://www.w3.org/2001/XMLSchema}int" />
</restriction> </complexContent></complexType>
```

Member Function Documentation

int [getCount](#) ()

Gets the value of the count property.

Returns:

possible object is [Integer](#)

java.util.List<[EntryPoint](#)> [getEntryPoint](#) ()

Gets the value of the entryPoint property.

This accessor method returns a reference to the live list, not a snapshot. Therefore any modification you make to the returned list will be present inside the JAXB object. This is why there is not a `set` method for the entryPoint property.

For example, to add a new item, do as follows:

```
getEntryPoint().add(newItem);
```

Objects of the following type(s) are allowed in the list [EntryPoint](#)

[Link](#) [getLink](#) ()

Gets the value of the link property.

Returns:

possible object is [Link](#)

[PaginationInfo](#) getPaginationInfo ()

Gets the value of the paginationInfo property.

Returns:

possible object is [PaginationInfo](#)

void setCount (int *value*)

Sets the value of the count property.

Parameters:

<i>value</i>	allowed object is Integer
--------------	---

void setLink ([Link](#) *value*)

Sets the value of the link property.

Parameters:

<i>value</i>	allowed object is Link
--------------	--

void setPaginationInfo ([PaginationInfo](#) *value*)

Sets the value of the paginationInfo property.

Parameters:

<i>value</i>	allowed object is PaginationInfo
--------------	--

</restriction> </complexContent></complexType>
```

Member Function Documentation

int [getCount](#) ()

Gets the value of the count property.

Returns:

possible object is [Integer](#)

java.util.List<[EntryPoint](#)> [getEntryPoint](#) ()

Gets the value of the entryPoint property.

This accessor method returns a reference to the live list, not a snapshot. Therefore any modification you make to the returned list will be present inside the JAXB object. This is why there is not a `set` method for the entryPoint property.

For example, to add a new item, do as follows:

```
getEntryPoint() .add(newItem);
```

Objects of the following type(s) are allowed in the list [EntryPoint](#)

[Link](#) [getLink](#) ()

Gets the value of the link property.

Returns:

possible object is [Link](#)

[PaginationInfo](#) getPaginationInfo ()

Gets the value of the paginationInfo property.

Returns:

possible object is [PaginationInfo](#)

void setCount (int *value*)

Sets the value of the count property.

Parameters:

<i>value</i>	allowed object is Integer
--------------	---

void setLink ([Link](#) *value*)

Sets the value of the link property.

Parameters:

<i>value</i>	allowed object is Link
--------------	--

void setPaginationInfo ([PaginationInfo](#) *value*)

Sets the value of the paginationInfo property.

Parameters:

<i>value</i>	allowed object is PaginationInfo
--------------	--

Error Class Reference

-

Detailed Description

Event Context

This schema contains information about the Event Context.

XML Schema File

model/v15/xsd/kb/event_context.xsd

Name	Description	Type
callId	The Call Identifier	String
tenantId	The Tenant Identifier	String

Member Function Documentation

java.lang.String [getCallId](#) ()

Gets the value of the callId property.

Returns:

possible object is [java.lang.String](#)

java.lang.String [getTenantId](#) ()

Gets the value of the tenantId property.

Returns:

possible object is [java.lang.String](#)

void [setCallId](#) (java.lang.String value)

Sets the value of the callId property.

Parameters:

value	allowed object is java.lang.String
-------	--

void [setTenantId](#) (java.lang.String value)

Sets the value of the tenantId property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

EventData Class Reference

</complexContent></complexType>
```

Member Function Documentation

java.lang.String [getApplicationId](#) ()

Gets the value of the applicationId property.

Returns:

possible object is [java.lang.String](#)

java.lang.String [getData](#) ()

Gets the value of the data property.

Returns:

possible object is [java.lang.String](#)

java.lang.String [getOperation](#) ()

Gets the value of the operation property.

Returns:

possible object is [java.lang.String](#)

java.lang.String getTenantId ()

Gets the value of the tenantId property.

Returns:

possible object is [java.lang.String](#)

void setApplicationId (java.lang.String value)

Sets the value of the applicationId property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setData (java.lang.String value)

Sets the value of the data property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setOperation (java.lang.String value)

Sets the value of the operation property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setTenantId (java.lang.String value)

Sets the value of the tenantId property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

-

Detailed Description

External Location Schema

This schema contains [ExternalLocation](#) type details.

XML Schema File

model/v12/xsd/kb/folder.xsd

Name	Description	Type
path	Path to the folder's external location	String
credentials	Credentials to connect to the machine of external location	Credentials
contentLanguage	Language of the Articles contained within this folder	Language
reimport	Re-import attributes	ReImport

Member Function Documentation

[Language](#) `getContentLanguage ()`

Gets the value of the contentLanguage property.

Returns:

possible object is [Language](#)

[Credentials](#) `getCredentials ()`

Gets the value of the credentials property.

Returns:

possible object is [Credentials](#)

java.lang.String getPath ()

Gets the value of the path property.

Returns:

possible object is [java.lang.String](#)

[ReImport](#) getReimport ()

Gets the value of the reimport property.

Returns:

possible object is [ReImport](#)

void setContentLanguage ([Language](#) value)

Sets the value of the contentLanguage property.

Parameters:

<i>value</i>	allowed object is Language
--------------	--

void setCredentials ([Credentials](#) value)

Sets the value of the credentials property.

Parameters:

<i>value</i>	allowed object is Credentials
--------------	---

void setPath (java.lang.String value)

Sets the value of the path property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setReimport ([ReImport](#) value)

Sets the value of the reimport property.

Parameters:

<i>value</i>	allowed object is ReImport
--------------	--

Detailed Description

Folder Schema

This schema contains [Folder](#) type details.

XML Schema File

model/v12/xsd/kb/folder.xsd

Name	Description	Type
id	Folder ID	Long
link	Self link to the folder	Link
name	Name of the folder	String
description	Description of the folder	String

lastModified	Date and user details when the folder was last modified	Created
created	Date and user details when the folder was created	Created
folders	Collection of folders within the folder	Folders
parent	Parent folder for the folder	Folder
articles	Collection of articles within the folder	Articles
department	Department of the folder	Department
access	Denotes, whether, the folder is 'public' or 'private'	String
owner	Details of User who own this folder	User
translate	Specifies, whether, the articles in this folder to be considered for translation when the content is exported for translation. Allowed values are : <ul style="list-style-type: none"> • 0 - No translation • 1 - Do translate 	Int
acl	Access Control List for this folder	ACL
language	Language of folder	Language
location	External location (file path) of the folder, if the folder is created from an external location	ExternalLocation

Member Function Documentation

`java.lang.String` `getAccess ()`

Gets the value of the access property.

Returns:

possible object is [java.lang.String](#)

[ACL](#) `getAcl ()`

Gets the value of the acl property.

Returns:

possible object is [ACL](#)

[Articles](#) getArticles ()

Gets the value of the articles property.

Returns:

possible object is [Articles](#)

[DateAndTime](#) getCreated ()

Gets the value of the created property.

Returns:

possible object is [DateAndTime](#)

[Department](#) getDepartment ()

Gets the value of the department property.

Returns:

possible object is [Department](#)

java.lang.String getDescription ()

Gets the value of the description property.

Returns:

possible object is [java.lang.String](#)

[Folders](#) getFolders ()

Gets the value of the folders property.

Returns:

possible object is [Folders](#)

long getId ()

Gets the value of the id property.

Returns:

possible object is [Long](#)

[Language](#) getLanguage ()

Gets the value of the language property.

Returns:

possible object is [Language](#)

[DateAndTime](#) getLastModified ()

Gets the value of the lastModified property.

Returns:

possible object is [DateAndTime](#)

[Link](#) getLink ()

Gets the value of the link property.

Returns:

possible object is [Link](#)

[ExternalLocation](#) getLocation ()

Gets the value of the location property.

Returns:

possible object is [ExternalLocation](#)

java.lang.String getName ()

Gets the value of the name property.

Returns:

possible object is [java.lang.String](#)

java.util.List<[User](#)> getOwner ()

Gets the value of the owner property.

This accessor method returns a reference to the live list, not a snapshot. Therefore any modification you make to the returned list will be present inside the JAXB object. This is why there is not a `set` method for the owner property.

For example, to add a new item, do as follows:

```
getOwner().add(newItem);
```

Objects of the following type(s) are allowed in the list [User](#)

[Folder](#) getParent ()

Gets the value of the parent property.

Returns:

possible object is [Folder](#)

Integer getTranslate ()

Gets the value of the translate property.

Returns:

possible object is [Integer](#)

void setAccess (java.lang.String value)

Sets the value of the access property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setAcl ([ACL](#) value)

Sets the value of the acl property.

Parameters:

<i>value</i>	allowed object is ACL
--------------	---------------------------------------

void setArticles ([Articles](#) value)

Sets the value of the articles property.

Parameters:

<i>value</i>	allowed object is Articles
--------------	--

void setCreated ([DateAndTime](#) value)

Sets the value of the created property.

Parameters:

<i>value</i>	allowed object is DateAndTime
--------------	---

void setDepartment ([Department](#) value)

Sets the value of the department property.

Parameters:

<i>value</i>	allowed object is Department
--------------	--

void setDescription (java.lang.String value)

Sets the value of the description property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setFolders ([Folders](#) value)

Sets the value of the folders property.

Parameters:

<i>value</i>	allowed object is Folders
--------------	---

void setId (long value)

Sets the value of the id property.

Parameters:

<i>value</i>	allowed object is Long
--------------	--

void setLanguage ([Language](#) value)

Sets the value of the language property.

Parameters:

<i>value</i>	allowed object is Language
--------------	--

void setLastModified ([DateAndTime](#) value)

Sets the value of the lastModified property.

Parameters:

<i>value</i>	allowed object is DateAndTime
--------------	---

void setLink ([Link](#) value)

Sets the value of the link property.

Parameters:

<i>value</i>	allowed object is Link
--------------	--

void setLocation ([ExternalLocation](#) value)

Sets the value of the location property.

Parameters:

<i>value</i>	allowed object is ExternalLocation
--------------	--

void setName (java.lang.String *value*)

Sets the value of the name property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setParent ([Folder](#) *value*)

Sets the value of the parent property.

Parameters:

<i>value</i>	allowed object is Folder
--------------	--

void setTranslate (Integer *value*)

Sets the value of the translate property.

Parameters:

<i>value</i>	allowed object is Integer
--------------	---

link	`self' link	Link
folder	Details of each folder	Folder
paginationInfo	Pagination details of folders	PaginationInfo
count	Total number of folders within this collection of folders	Int

Member Function Documentation

int [getCount](#) ()

Gets the value of the count property.

Returns:

possible object is [Integer](#)

java.util.List<[Folder](#)> [getFolder](#) ()

Gets the value of the folder property.

This accessor method returns a reference to the live list, not a snapshot. Therefore any modification you make to the returned list will be present inside the JAXB object. This is why there is not a `set` method for the folder property.

For example, to add a new item, do as follows:

```
getFolder ().add (newItem) ;
```

Objects of the following type(s) are allowed in the list [Folder](#)

[Link](#) getLink ()

Gets the value of the link property.

Returns:

possible object is [Link](#)

[PaginationInfo](#) getPaginationInfo ()

Gets the value of the paginationInfo property.

Returns:

possible object is [PaginationInfo](#)

void setCount (int *value*)

Sets the value of the count property.

Parameters:

<i>value</i>	allowed object is Integer
--------------	---

void setLink ([Link](#) *value*)

Sets the value of the link property.

Parameters:

<i>value</i>	allowed object is Link
--------------	--

void setPaginationInfo ([PaginationInfo](#) *value*)

Sets the value of the paginationInfo property.

Parameters:

<i>value</i>	allowed object is PaginationInfo
--------------	--

GetActivitiesByIdsPage Class Reference

Detailed Description

Get Activities by IDs

Overview

This API allows a user to retrieve one or more activities identified by activity IDs. To provide multiple IDs, a comma separated string must be passed in the request URI. A maximum of 75 IDs are allowed per request. Neither pagination nor range query parameters are supported by this API.

Since:

11.6

APIs

Method	URL	Description
GET	/ws/v12/interaction/activity/{IDs}	Retrieve activities by their IDs. {IDs}: a comma separated string of activity IDs.

Authentication

Authentication is required. The client must be logged in to call this API. Each API request must contain X-egain-session request header returned by Login API.

Permissions

All of the following are required:

- 'View Agent Console' action.
- All requested activities must satisfy one of the following:
 - activity belongs to user's home department
 - activity belongs to a department where the user is a foreign user
 - the department of the activity is shared with the department of the user, and as part of this sharing, activity sharing is enabled as well

Licenses

The logged in user must have the following licenses:

- ECE CIH Platform

Request

Request headers

Name	Description	Allowed values	Default value
X-egain-session	Session ID obtained from Login API response header	N/A	N/A
Accept	Content type accepted by client	application/xml or application/json	N/A
Accept-Language	Language locale accepted by client (used for locale specific fields in resource representation and in error responses)	Supported 'Accept-Language' header codes	default system language

Supported API specific query parameters

None

Supported common query parameters

Refer to [Supported Common Query Parameters in ECE REST API](#) page for detailed description of each common parameter listed below.

- \$attribute - [Values of \\$attribute common parameter supported by Activity Resource](#)
- \$sort - [Values of \\$sort common parameter supported by Activity Resource](#)
- \$order

Response

Response headers

Name	Description	Possible values
X-egain-session	Session ID of the current user session	N/A
Content-Type	Media type of response body	application/xml or application/json

Response body xml schemas:

- [Activities Schema](#) - used in case of success
- [Error](#) - used in case of error

Summary attributes always returned in server response

[Summary attributes of Activity Resource](#)

Additional attributes returned in server response if explicitly requested by client

Server can be prompted to return additional attributes of resource representation using `$attribute` common query parameter. [Values of \\$attribute common parameter supported by Activity Resource](#) for the list of allowed attribute names.

HTTP status codes

Success Status codes

200 - OK

- The request was successfully executed

Failure Status codes

400 - Bad Request

- Unsupported query or common parameter in request URL
- Invalid value of common parameter in request URL (e.g., unallowed value of `$order` , unsupported `$attribute` value etc.)
- `$order` provided without `$sort`
- More than 75 IDs are supplied in request URL

401 - Unauthorized

- X-egain-session request header is missing
- Session is invalid or expired

403 - Forbidden

- The user does not have sufficient permissions to view one or more of the requested resources

404 - Not Found

- One or more of the requested resource IDs does not exist

406 - Not Acceptable

- Invalid 'Accept-Language' header value

500 - Internal server error

Examples:

[Example 1 - Get all attributes for an email activity](#)

[Example 2 - Get all attributes for a chat activity](#)

v12-interaction-activity-getbyid-example3

v12-interaction-activity-getbyid-example4

[Example 5 - Get all attributes for a web activity](#)

[Example 6 - Get an additional attribute for multiple activities sorted on department name](#)

[Example 7 - Get an additional custom attribute for a single activity](#)

[Example 8 - Get summary attributes and payload for activities of all types](#)

GetActivityAttachmentsExamples Class Reference

Detailed Description

Examples for Get activity attachments

Example 1 - Get attachment of an activity

This example demonstrates the following:

- Get the list of attachments for an activity
- Representation of the response having a single attachment.

XML

Request

Method	URL
GET	/ws/v15/context/interaction/activity/1047/attachment

Request headers

Name	Values
X-egain-session	valid session ID
Accept	application/xml
Accept-Language	en-US

Response:

HTTP/1.1 200 OK

Response headers

Name	Values
X-egain-session	current session ID
Content-Type	application/xml

Response body

```
<?xml version="1.0" encoding="UTF-8" standalone="yes" ?><attachments
xmlns="http://bindings.egain.com/ws/model/v15/gen/interaction/attachment"
id="1000"
  <link rel="self"
href="/system/ws/v15/context/interaction/activity/1047/attachment/1000"/>
  <fileName>Gift
Coupon.jpg</fileName>
  <contentType>image/pjpeg</contentType>
  <size>172276</size>
  <encodingType>Base 64</encodingType>
  <isBlocked>>false</isBlocked>
</attachment></attachments>
```

JSON

Request

Method	URL
GET	/ws/v15/context/interaction/activity/1047/attachment

Request headers

Name	Values
X-egain-session	valid session ID
Accept	application/json
Accept-Language	en-US

Response:

HTTP/1.1 200 OK

Response headers

Name	Values
X-egain-session	current session ID
Content-Type	application/json

Response body

```
{  "attachment": [    {      "link": {        "rel": "self",        "href": "/system/ws/v15/context/interaction/activity/1047/attachment/1000"      },      "fileName": "Gift Coupon.jpg",      "contentType": "image/jpeg",      "size": 172276,      "encodingType": "Base 64",      "isBlocked": false,      "id": 1000    }  ]}
```

Example 2 - Get attachments of an activity having multiple attachments

This example demonstrates the following:

- Get the list of attachments for an activity
- Representation of the response having a multiple attachments. This example has 2 attachments in the response.

XML

Request

Method	URL
GET	/ws/v15/context/interaction/activity/1059/attachment

```

JSON

Request

Method	URL
GET	/ws/v15/context/interaction/activity/1059/attachment

Request headers

Name	Values
X-egain-session	valid session ID
Accept	application/json
Accept-Language	en-US

Response:
HTTP/1.1 200 OK

Response headers

Name	Values
X-egain-session	current session ID
Content-Type	application/json

Response body

```
{
  "attachment": [
    {
      "link": {
        "rel": "self",
        "href": "/system/ws/v15/context/interaction/activity/1059/attachment/1006"
      },
      "fileName": "tv.jpeg",
      "contentType": "image/jpeg",
      "size": 3111,
    }
  ]
}
```

```
"encodingType": "Base 64", "isBlocked": false, "id": 1006 }, {
"link": { "rel": "self", "href":
"/system/ws/v15/context/interaction/activity/1059/attachment/1007"
},
"fileName": "requirements.txt", "contentType": "text/plain", "size": 1201,
"encodingType": "Base 64", "isBlocked": false, "id": 1007 } ]}
```

Example 3 - Get attachment of an activity of another customer

This example demonstrates the following:

- Get the attachments of an activity of another customer.
- Get the list of attachments for an activity
- URLs in the links when activity belongs to another customer.

XML

Request

Method	URL
GET	ws/v15/context/interaction/activity/1013/attachment?customer=1001

Request headers

Name	Values
X-egain-session	valid session ID
Accept	application/xml
Accept-Language	en-US

Response:

HTTP/1.1 200 OK

Response headers

Name	Values
X-egain-session	current session ID
Content-Type	application/xml

Response body

```
<?xml version="1.0" encoding="UTF-8" standalone="yes" ?><attachments
xmlns="http://bindings.egain.com/ws/model/v15/gen/interaction/attachment"> <attachment
id="1024"> <link rel="self"

<fileName>session_test.html</fileName> <contentType>text/html</contentType>
<size>6074</size> <encodingType>Base 64</encodingType> <isBlocked>>false</isBlocked>
</attachment></attachments>
```

JSON

Request

Method	URL
GET	ws/v15/context/interaction/activity/1013/attachment?customer=1001

Request headers

Name	Values
X-egain-session	valid session ID
Accept	application/json
Accept-Language	en-US

Response:

HTTP/1.1 200 OK

Response headers

Name	Values
X-egain-session	current session ID
Content-Type	application/json

Response body

```
{  "attachment": [    {      "link": {        "rel": "self",        "href": "/system/ws/v15/context/interaction/activity/1013/attachment/1024?customer=1001"      },      "fileName": "session_test.html",      "contentType": "text/html",      "size": 6074,      "encodingType": "Base 64",      "isBlocked": false,      "id": 1024    }  ]}
```

GetActivityAttachmentsPage Class Reference

Detailed Description

Get activity attachments

Overview

This API allows the customer to get the list of attachments of a specific activity.

Since:

11.6

APIs

Method	URL	Description
GET	/ws/v15/context/interaction/activity/{ID}/attachment	Retrieve attachments of an activity with ID: {ID}

Authentication

Authentication is required. The customer must be logged in to call this API. Each API request must contain X-egain-session request header returned by Login API.

Permissions

- All authenticated customers can access this API.
- Only attachments of the activities that are visible to the customer (self, or customer sent in as query parameter) will be returned. Refer the page [Activities visible to a customer](#) for more information about the activities visible to the customer.
- If the query parameter customer={ID} is provided, the logged in customer must be authorized to perform this action on behalf of the customer specified through the 'customer' parameter. Otherwise, the application will return a 400 (bad request) response code. Refer [Customer grants](#) for more information about authorization.

Request

Request headers

Name	Description	Allowed values	Default value
X-egain-session	Session ID obtained from Login API response header	N/A	N/A
Accept	Content type accepted by client	application/xml or application/j	N/A

		son	
Accept-Language	Language locale accepted by client (used for locale specific fields in resource representation and in error responses)	Supported 'Accept-Language' header codes	default system language

Supported API specific query parameters

The below API specific parameters are supported:

- customer={ID}: ID of the customer to whom the activity belongs to. For this API to be successful, the logged in customer must be authorized to perform this action on behalf of the customer specified through "customer" query parameter. Refer [Customer grants](#) for more information about authorization.

Supported common query parameters

None

Response

Response headers

Name	Description	Possible values
X-egain-session	Session ID of the current user session	N/A
Content-Type	Media type of response body	application/xml or application/json

Response body xml schemas:

- [Attachments Schema](#) - used in case of success
- [Error](#) - used in case of error

Summary attributes always returned in server response

[Summary attributes of Attachment Resource](#)

HTTP status codes

Success Status codes

200 - OK

- The request was successfully executed

204 - No Content

- No attachments exist for the activity

Failure Status codes

400 - Bad Request

- Any unsupported query parameter is sent in the request
- The logged in customer does not have grants on the customer provided through the query parameter "customer".

401 - Unauthorized

- X-egain-session request header is missing
- Session is invalid or expired

404 - Not Found

- Activity ID supplied in the URI doesn't exist.
- Activity ID supplied in the URI is not visible to the logged in customer.

406 - Not Acceptable

- Invalid 'Accept-Language' header value

500 - Internal server error

Examples:

[Example 1 - Get attachment of an activity](#)

[Example 2 - Get attachments of an activity having multiple attachments](#)

[Example 3 - Get attachment of an activity of another customer](#)

GetActivityAttributesExamples Class Reference

Detailed Description

Examples for Retrieve Activity Attribute Metadata

Example 1 - Get activity type attributes

This example demonstrates the following:

- Getting metadata for a single attribute. This example retrieves the details of the "type" attribute of the activity resource.

XML

Request

Method	URL
GET	/ws/v12/interaction/activity/attributes?\$attribute=type

Request headers

Name	Values
X-egain-session	valid session ID
Accept	application/xml
Accept-Language	en-US

Response headers

Name	Values
X-egain-session	current session ID
Content-Type	application/xml

Response body

Response:
HTTP/1.1 200 OK

JSON

Request

Method	URL
GET	/ws/v12/interaction/activity

	/attributes?\$attribute=type
--	------------------------------

Request headers

Name	Values
X-egain-session	valid session ID
Accept	application/json
Accept-Language	en-US

Response headers

Name	Values
X-egain-session	current session ID
Content-Type	application/json

Response body

Response:

HTTP/1.1 200 OK

Example 2 - Get activity custom attributes

This example demonstrates the following:

- Getting the metadata for custom attributes of the activity resource.

XML

Request

Method	URL
GET	/ws/v12/interaction/activity/attributes?\$attribute=custom

Request headers

Name	Values
X-egain-session	valid session ID
Accept	application/xml
Accept-Language	en-US

Response headers

Name	Values
X-egain-session	current session ID
Content-Type	application/xml

Response body

```

```

Response:

HTTP/1.1 200 OK

Example 3 - Get all activity attributes

This example demonstrates the following:

- Getting the metadata for all the attributes of the activity resource. This includes metadata for "type" attribute and custom attributes.

GetActivityByIdExamples Class Reference

Detailed Description

Examples for Get Activity by ID

Example 1 - Get all attributes of an email activity

This example demonstrates the following:

- Getting all attributes of an email activity based on activity ID.
- Representation of the email payload, including content
- Representation of custom attributes in the response.

```

Example 3 - Get all attributes of a chat activity

This example demonstrates the following:

- Getting all attributes of a chat activity based on activity ID.
- Representation of the chat activity payload
- Representation of a custom attribute in the activity representation.

GetActivityByIdPage Class Reference

Detailed Description

Get activity by ID

Overview

This API allows a user to retrieve an activity identified by activity ID.

This API will succeed only if the requested activity is visible to the customer. Refer the page [Activities visible to a customer](#) for more information about the activities visible to the customer.

Since:

11.6

APIs

Method	URL	Description
GET	/ws/v15/context/interaction/activity/{ID}	Retrieve activity by ID. {ID}: activity ID.

Authentication

Authentication is required. The customer must be logged in to call this API. Each API request must contain X-egain-session request header returned by Login API.

Permissions

- All authenticated customers can access this API.
- Only activities that the customer (self, or customer sent in as query parameter) can view will be returned (refer the [Overview](#) section for details). If the customer cannot view the activity, the application will return 404 response code.
- If the query parameter customer={ID} is provided, the logged in customer must be authorized to perform this action on behalf of the customer specified through the "customer" parameter. Otherwise, the application will return a 400 (bad request) response code. Refer [Customer grants](#) for more information about authorization.

Request

Request headers

Name	Description	Allowed values	Default value
X-egain-session	Session ID obtained from Login API response header	N/A	N/A

Accept	Content type accepted by client	application/xml or application/json	N/A
Accept-Language	Language locale accepted by client (used for locale specific fields in resource representation and in error responses)	Supported 'Accept-Language' header codes	default system language

Supported API specific query parameters

The below API specific parameters are supported:

- customer={ID}: ID of the customer of the activity. For this API to be successful, the logged in customer must be authorized to perform this action on behalf of the customer specified through "customer" query parameter. Refer [Customer grants](#) for more information about authorization.

Supported common query parameters

Refer to [Supported Common Query Parameters in ECE REST API](#) page for detailed description of each common parameter listed below.

- \$attribute - [Values of \\$attribute common parameter supported by Activity Resource](#)
- \$sort - [Values of \\$sort common parameter supported by Activity Resource](#)
- \$order

Response

Response headers

Name	Description	Possible values
X-egain-session	Session ID of the current user session	N/A
Content-Type	Media type of response body	application/xml or application/json

Response body xml schemas:

- [Activities Schema](#) - used in case of success
- [Error](#) - used in case of error

Summary attributes always returned in server response

[Summary attributes of Activity Resource](#)

Additional attributes returned in server response if explicitly requested by client

Server can be prompted to return additional attributes of resource representation using

`$attribute` common query parameter. [Values of \\$attribute common parameter supported by Activity Resource](#) for the list of allowed attribute names.

HTTP status codes

Success Status codes

200 - OK

- The request was successfully executed

Failure Status codes

400 - Bad Request

- Unsupported query parameter is provided in the request
- Invalid value of common parameter in request URL (e.g. unsupported `$attribute` value)
- The logged in customer does not have grants on the customer provided through the query parameter "customer".

401 - Unauthorized

- X-egain-session request header is missing
- Session is invalid or expired

404 - Not Found

- Requested activity ID does not exist
- Requested activity ID is not visible to the logged in customer

406 - Not Acceptable

- Invalid 'Accept-Language' header value

500 - Internal server error

Examples:

[Example 1 - Get all attributes of an email activity](#)

context-get-activity-by-id-example2

[Example 3 - Get all attributes of a chat activity](#)

context-get-activity-by-id-example4

[Example 5 - Get summary attributes and an additional custom attribute of an email activity](#)

[Example 6 - Get summary attributes of an email activity of another customer](#)

GetAttachmentByIdExamples Class Reference

Detailed Description

Examples for Get attachment by ID

Example 1 - Get summary attributes for an attachment

This example demonstrates the following:

- Getting summary attributes for attachment of an activity.

XML

Request

Method	URL
GET	/ws/v15/context/interaction/activity/1059/attachment/1006

Request headers

Name	Values
X-egain-session	valid session ID
Accept	application/xml
Accept-Language	en-US

Response:

HTTP/1.1 200 OK

Response headers

Name	Values
X-egain-session	current session ID
Content-Type	application/xml

Response body

```
<?xml version="1.0" encoding="UTF-8" standalone="yes" ?><attachments
xmlns="http://bindings.egain.com/ws/model/v15/gen/interaction/attachment"
id="1006">
  <link rel="self"
href="/system/ws/v15/context/interaction/activity/1059/attachment/1006"/>
  <fileName>tv.jpeg</fileName>
  <contentType>image/jpeg</contentType>
  <size>3111</size>
  <encodingType>Base 64</encodingType>
  <isBlocked>>false</isBlocked>
</attachment></attachments>
```

JSON

Request

Method	URL
GET	/ws/v15/context/interaction/activity/1059/attachment/1006

Request headers

Name	Values
X-egain-session	valid session ID
Accept	application/json
Accept-Language	en-US

Response:

HTTP/1.1 200 OK

Response headers

Name	Values
X-egain-session	current session ID
Content-Type	application/json

Response body

```
{  "attachment": [    {      "link": {        "rel": "self",        "href": "/system/ws/v15/context/interaction/activity/1059/attachment/1006"      },      "fileName": "tv.jpeg",      "contentType": "image/jpeg",      "size": 3111,      "encodingType": "Base 64",      "isBlocked": false,      "id": 1006    }  ]}
```

Example 2 - Get summary attributes and content URL for an attachment

This example demonstrates the following:

- Getting summary attributes and contentUrl attribute for an attachment.

XML

Request

Method	URL
GET	/ws/v15/context/interaction/activity/1059/attachment/1006?\$attribute=contentUrl

Request headers

Name	Values
------	--------

X-egain-session	valid session ID
Accept	application/xml
Accept-Language	en-US

Response:

HTTP/1.1 200 OK

Response headers

Name	Values
X-egain-session	current session ID
Content-Type	application/xml

Response body

```
<?xml version="1.0" encoding="UTF-8" standalone="yes" ?><attachments
xmlns="http://bindings.egain.com/ws/model/v15/gen/interaction/attachment" >
  <attachment id="1006">

```

GetAttachmentByIdPage Class Reference

Detailed Description

Get attachment details

Overview

This API allows the customer to get details for a single attachment belonging to a specific activity.

If requested, one of the response attributes is the `contentUrl`, which can be used to download the content of the attachment. This only exists temporarily on the server. The client should immediately download the attachment content if needed. The attachment can be retrieved only once as it is deleted from the server after download.

Since:

11.6

APIs

Method	URL	Description
GET	<code>/ws/v15/context/interaction/activity/{ID1}/attachment/{ID2}</code>	Retrieve details for an attachment having ID: {ID2} belonging to an activity having ID: {ID1}

Authentication

Authentication is required. The customer must be logged in to call this API. Each API request must contain X-egain-session request header returned by Login API.

Permissions

- All authenticated customers can access this API.
- Only attachment of the activities that are visible to the customer (self, or customer sent in as query parameter) will be returned. Refer the page [Activities visible to a customer](#) for more information about the activities visible to the customer.
- If the query parameter `customer={ID}` is provided, the logged in customer must be authorized to perform this action on behalf of the customer specified through the 'customer' parameter. Otherwise, the application will return a 400 (bad request) response code. Refer [Customer grants](#) for more information about authorization.
- If the attachment is blocked in ECE application, the user will not be able to download the content.

Request

Request headers

Name	Description	Allowed values	Default value
------	-------------	----------------	---------------

X-egain-session	Session ID obtained from Login API response header	N/A	N/A
Accept	Content type accepted by client	application/xml or application/json	N/A
Accept-Language	Language locale accepted by client (used for locale specific fields in resource representation and in error responses)	Supported 'Accept-Language' header codes	default system language

Supported API specific query parameters

The below API specific parameters are supported:

- customer={ID}: ID of the customer of the activity. For this API to be successful, the logged in customer must be authorized to perform this action on behalf of the customer specified through "customer" query parameter. Refer [Customer grants](#) for more information about authorization.

Supported common query parameters

Refer to [Supported Common Query Parameters in ECE REST API](#) page for detailed description of each common parameter listed below.

- \$attribute - [Values of \\$attribute common parameter supported by Attachment Resource](#)

Response

Response headers

Name	Description	Possible values
X-egain-session	Session ID of the current user session	N/A
Content-Type	Media type of response body	application/xml or application/json

Response body xml schemas:

- [Attachments Schema](#) - used in case of success
- [Error](#) - used in case of error

Summary attributes always returned in server response

[Summary attributes of Attachment Resource](#)

HTTP status codes

Success Status codes

200 - OK

- The request was successfully executed

Failure Status codes

400 - Bad Request

- Any unsupported API specific query parameter is provided in request.
- Any unsupported common query parameter is provided in request.
- The logged in customer does not have grants on the customer provided through the query parameter "customer".

401 - Unauthorized

- X-renew-session request header is missing
- Session is invalid or expired

403 - Forbidden

- Attachment ID supplied in the URI is blocked in ECE application

404 - Not Found

- Activity ID supplied in the URI doesn't exist.
- Activity ID supplied in the URI is not visible to the logged in customer.
- Attachment ID supplied in the URI doesn't exist for the given activity.

406 - Not Acceptable

- Invalid 'Accept-Language' header value

500 - Internal server error

Examples:

[Example 1 - Get summary attributes for an attachment](#)

[Example 2 - Get summary attributes and content URL for an attachment](#)

[Example 3 - Get all attributes for an attachment](#)

[Example 4 - Get all attributes for an attachment of another customer](#)

GetAttachmentDetails Class Reference

Detailed Description

Get Attachment Details

Overview

This API allows the user to get details for an attachment belonging to a specific activity. If requested, one of the response attributes is the `contentUrl`, which can be used to download the content of the attachment. This only exists temporarily on the server. The client should immediately download the attachment content if needed. The attachment can be retrieved only once as it is deleted from the server after download.

Since:

11.6

APIs

Method	URL	Description
GET	<code>/ws/v12/interaction/activity/{ID1}/attachment{ID2}</code>	Retrieve details for an attachment having ID: {ID2} belonging to an activity having ID: {ID1}

Authentication

Authentication is required. The client must be logged in to call this API. Each API request must contain X-again-session request header returned by Login API.

Permissions

If the logged in agent can see the activity, then the agent is able to see its attachments. All of the following are required:

- 'View Agent Console' action
- The requested activity must belong to the user's home department, or to the department where the user is a foreign user

Licenses

The logged in user must have the following licenses:

- ECE CIH Platform

Request

Request headers

Name	Description	Allowed values	Default value
X-egain-session	Session ID obtained from Login API response header	N/A	N/A
Accept	Content type accepted by client	application/xml or application/json	N/A
Accept-Language	Language locale accepted by client (used for locale specific fields in resource representation and in error responses)	Supported 'Accept-Language' header codes	default system language

Supported API specific query parameters

NONE

Supported common query parameters

Refer to [Supported Common Query Parameters in ECE REST API](#) page for detailed description of each common parameter listed below.

- \$attribute - [Values of \\$attribute common parameter supported by Attachment Resource](#)

Response

Response headers

Name	Description	Possible values
X-egain-session	Session ID of the current user session	N/A
Content-Type	Media type of response body	application/xml or application/json

Response body xml schemas:

- [Attachment Schema](#) - used in case of success
- [Error](#) - used in case of error

Summary attributes

[Summary attributes of Attachment Resource](#)

HTTP status codes

Success Status codes:

200 (OK)

- This response code is returned if the request is successful

Failure Status codes:

400 (Bad request)

- {ID1} or {ID2} are not passed
- Unsupported query parameter is sent in request URL.
- Required common query parameter is not provided. Refer [Supported common query parameters](#) section for more details.

401 (Unauthorized)

- X-egain-session header is missing
- Session is invalid

403 (Forbidden)

- The user does not have the appropriate permissions for this information

404 (Not found)

- Activity ID supplied in the URI doesn't exist
- Attachment ID supplied in the URI doesn't exist for the given activity

500 (Internal server error)

- There are any other errors while processing the request.

Examples:

[Example 1 - Get details of an attachment](#)

[Example 2 - Get contentUrl along with details for an attachment](#)

[Example 3 - Get all attributes along with details for an attachment](#)

GetAttachmentsForActivity Class Reference

Detailed Description

Get Activity Attachments

Overview

This API allows the user to get details for all attachments belonging to a specific activity.

Since:

11.6

APIs

Method	URL	Description
GET	/ws/v12/interaction/activity/{ID}/attachment	Retrieve attachments belong to activity with ID: {ID}

Authentication

Authentication is required. The client must be logged in to call this API. Each API request must contain X-egain-session request header returned by Login API.

Permissions

All of the following are required:

- 'View Agent Console' action
- All requested activities must belong to either the user's home department, or to the department where the user is a foreign user

Licenses

The logged in user must have the following licenses:

- ECE CIH Platform

Request

Request headers

Name	Description	Allowed values	Default value
X-egain-session	Session ID obtained from Login API response header	N/A	N/A
Accept	Content type	application/x	N/A

	accepted by client	ml or application/json	
Accept-Language	Language locale accepted by client (used for locale specific fields in resource representation and in error responses)	Supported 'Accept-Language' header codes	default system language

Supported API specific query parameters

NONE

Supported common query parameters

NONE

Response

Response headers

Name	Description	Possible values
X-egain-session	Session ID of the current user session	N/A
Content-Type	Media type of response body	application/xml or application/json

Response body xml schemas:

- [Attachments Schema](#) - used in case of success
- [Error](#) - used in case of error

Summary attributes

[Summary attributes of Attachment Resource](#)

HTTP status codes

Success Status codes:

200 (OK)

- This response code is returned if the request is successful

204 (No content)

- No attachments exist for the valid activity ID

Failure Status codes:**400 (Bad request)**

- {ID} is not passed
- Any query parameter is sent in the request

401 (Unauthorized)

- X-egain-session header is missing
- Session is invalid

403 (Forbidden)

- The user does not have the appropriate permissions for this information

404 (Not found)

- Activity ID supplied in the URI doesn't exist

500 (Internal server error)

- There are any other errors while processing the request.

Examples:

[Example 1 - Get all attachments for an activity](#)

GetByIDsHttpStatusCodes Class Reference

Detailed Description

Success Status codes

200 - OK

- The request was successfully executed

Failure Status codes

400 - Bad Request

- Unsupported query or common parameter in request URL
- Invalid value of common parameter in request URL (e.g., unallowed value of `$order` , unsupported `$attribute` value etc.)
- `$order` provided without `$sort`
- More than 75 IDs are supplied in request URL

401 - Unauthorized

- X-egain-session request header is missing
- Session is invalid or expired

403 - Forbidden

- The user does not have sufficient permissions to view one or more of the requested resources

404 - Not Found

- One or more of the requested resource IDs does not exist

406 - Not Acceptable

- Invalid 'Accept-Language' header value

500 - Internal server error

GetCaseAttributesExamples Class Reference

Detailed Description

Examples for Retrieve Case Attribute Metadata

Example 1 - Get the metadata for custom attributes

This example demonstrates the following:

- Getting the metadata for custom attributes of case resource.

XML

Request

Method	URL
GET	/ws/v12/interaction/case/attributes?\$attribute=custom

Request headers

Name	Values
X-egain-session	valid session ID
Accept	application/xml
Accept-Language	en-US

Response:

HTTP/1.1 200 OK

Response headers

Name	Values
X-egain-session	current session ID
Content-Type	application/xml

Response body

```
<?xml version="1.0" encoding="UTF-8"?><attributes
xmlns="http://bindings.egain.com/ws/model/v12/gen/common/attribute" resource="case">
<attribute name="duration" custom="true" <dataSize>9</dataSize>
<dataType>integer</dataType> </attribute> <attribute name="priorcaselist" custom="true">
<dataSize>1024</dataSize> <dataType>string</dataType> </attribute> <attribute
name="issuetype" custom="true"> <dataSize>255</dataSize>
<dataType>stringList</dataType> <options isMultiSelect="false"> <option>
<value>1</value> <displayValue>Electrical</displayValue> </option>
<option isDefault="true"> <value>2</value>
<displayValue>Mechanical</displayValue> </option> <option>
<value>3</value> <displayValue>Body</displayValue> </option>
</options> </attribute></attributes>
```

JSON

Request

Method	URL
GET	/ws/v12/interaction/case/attributes?\$attribute=custom

Request headers

Name	Values
X-egain-session	valid session ID
Accept	application/json
Accept-Language	en-US

Response:

HTTP/1.1 200 OK

Response headers

Name	Values
X-egain-session	current session ID
Content-Type	application/json

Response body

```
{  "attribute": [    {      "name": "duration",      "dataSize": 9,      "dataType": "integer",      "custom": true    },    {      "name": "priorcaselist",      "dataSize": 1024,      "dataType": "string",      "custom": true    },    {      "name": "issuetype",      "dataSize": 255,      "dataType": "stringList",      "custom": true,      "options": {        "value": "1",        "displayValue": "Electrical"      },      "value": "2",      "displayValue": "Mechanical",      "isDefault": true    },    {      "name": "issuetype",      "dataSize": 255,      "dataType": "stringList",      "custom": true,      "options": {        "value": "3",        "displayValue": "Body"      },      "value": "3",      "displayValue": "Body",      "isMultiSelect": false    }  ],  "resource": "case"}
```

GetCaseAttributesPage Class Reference

Detailed Description

Get Case Attributes

Overview

This API allows retrieving the metadata for custom attributes of case resource.

Since:

11.6

APIs

Method	URL	Description
GET	/ws/v12/interaction/case/attributes	Retrieve attribute metadata for case resource.

Authentication

Authentication is required. The client must be logged in to call this API. Each API request must contain X-egain-session request header returned by Login API.

Permissions

No permissions are required.

Licenses

The logged in user must have the following licenses:

- ECE CIH Platform

Request

Request headers

Name	Description	Allowed values	Default value
X-egain-session	Session ID obtained from Login API response header	N/A	N/A
Accept	Content type accepted by client	application/xml or application/json	N/A
Accept-Language	Language locale accepted by client	Supported 'Accept-Language'	default system language

	(used for locale specific fields in resource representation and in error responses)	header codes	
--	---	--------------	--

Supported API specific query parameters

None.

Supported common query parameters

- \$attribute: Must be provided to get metadata for case attributes. Refer to [Supported Common Query Parameters in ECE REST API](#) for details.

The value of \$attribute must be "custom".

Response

Response headers

Name	Description	Possible values
X-egain-session	Session ID of the current user session	N/A
Content-Type	Media type of response body	application/xml or application/json

Response body

The response body can be in either XML or JSON format.

Response body XML schemas:

- [Attributes Schema](#) - used in case of success
- [Error](#) - used in case of error

HTTP status codes

Success Status codes

200 - OK

- The request executed successfully.

204 - No content

- No content to return. Applicable when no custom attributes are configured for the case resource.

Failure Status codes

400 - Bad Request

- Unsupported query parameter is sent in request URL.
- Required common query parameter is not provided. Refer [Supported common query parameters](#) section for more details.

401 - Unauthorized

- X-egain-session request header is missing.
- Session is invalid or expired.

406 - Not Acceptable

- Invalid 'Accept-Language' header value.

500 - Internal server error

Examples:

[Example 1 - Get the metadata for custom attributes](#)

GetCaseByldExamples Class Reference

GetCaseByIdPage Class Reference

Detailed Description

Get case by ID

Overview

This API allows users to retrieve a case identified by case ID.

This API will succeed only if the requested case contains at least one activity visible to the customer (self, or customer specified through "customer" query parameter). Refer the page [Activities visible to a customer](#) for more information about the activities visible to the customer.

Since:

11.6

APIs

Method	URL	Description
GET	/ws/v15/context/interaction/case/{ID}	Retrieve case by ID.{ID}: case ID.

Authentication

Authentication is required. The customer must be logged in to call this API. Each API request must contain X-egain-session request header returned by Login API.

Permissions

- All authenticated customers can access this API.
- If the query parameter customer={ID} is provided, the logged in customer must be authorized to perform this action on behalf of the customer specified through the "customer" query parameter. Otherwise, the application will return a 400 (bad request) response code. Refer [Customer grants](#) for more information about authorization.

Request

Request headers

Name	Description	Allowed values	Default value
X-egain-session	Session ID obtained from Login API response header	N/A	N/A
Accept	Content type accepted by client	application/xml or application/json	N/A

		son	
Accept-Language	Language locale accepted by client (used for locale specific fields in resource representation and in error responses)	Supported 'Accept-Language' header codes	default system language

Supported API specific query parameters

The below API specific parameters are supported:

- customer={ID}: ID of the customer of the case. For this API to be successful, the logged in customer must be authorized to perform this action on behalf of the customer specified through "customer" query parameter. Refer [Customer grants](#) for more information about authorization.

Supported common query parameters

Refer to [Supported Common Query Parameters in ECE REST API](#) page for detailed description of each common parameter listed below.

- \$attribute - [Values of \\$attribute common parameter supported by Case Resource](#)

Response

Response headers

Name	Description	Possible values
X-egain-session	Session ID of the current user session	N/A
Content-Type	Media type of response body	application/xml or application/json

Response body xml schemas:

- [Cases Schema](#) - used in case of success
- [Error](#) - used in case of error

Summary attributes always returned in server response

See [Summary attributes of Case Resource](#) for the list of summary attributes returned in server response.

NOTE: If the case belongs to the logged in customer, all requested attributes will be returned. If the case belongs to a different customer, then all requested attributes except customer would be returned.

Additional attributes returned in server response if explicitly requested by client

Server can be prompted to return additional attributes of resource representation using \$attribute common query parameter. [Values of \\$attribute common parameter supported by](#)

[Case Resource](#) for the list of allowed attribute names.

HTTP status codes

Success Status codes

200 - OK

- The request was successfully executed

Failure Status codes

400 - Bad Request

- Unsupported query parameter is provided in the request
- Invalid value of common parameter in request URL (e.g. unsupported \$attribute value)
- The logged in customer does not have grants on the customer provided through the query parameter "customer".

401 - Unauthorized

- X-egain-session request header is missing
- Session is invalid or expired

404 - Not Found

- Requested case ID does not exist
- Requested case ID is not visible to the logged in customer

406 - Not Acceptable

- Invalid 'Accept-Language' header value

500 - Internal server error

Examples:

[Example 1 - Get summary attributes of a case](#)

[Example 2 - Get summary attributes and an additional attribute of a case](#)

[Example 3 - Get all attributes of a case](#)

[Example 4 - Get summary attributes of a case of another customer](#)

GetCasesByIdsPage Class Reference

Detailed Description

Get Cases by IDs

Overview

This API allows users to retrieve one or more cases identified by case IDs. To provide multiple IDs, a comma separated string must be used in request URI. A maximum of 75 IDs is allowed per request. Neither pagination nor range query parameters are supported by this API.

Since:

11.6

APIs

Method	URL	Description
GET	/ws/v12/interaction/case/{IDs}	Retrieve cases by their IDs. {IDs}: a comma separated string of case IDs.

Authentication

Authentication is required. The client must be logged in to call this API. Each API request must contain X-again-session request header returned by Login API.

Permissions

All of the following are required:

- 'View Agent Console' action.
- All requested cases must satisfy one of the following:
 - case belongs to user's home department;
 - case belongs to a department where the user is a foreign user;
 - the department of the case is shared with the department of the user, and as part of this sharing, activity sharing is enabled as well.

Licenses

The logged in user must have the following licenses:

- ECE CIH Platform

Request

Request headers

Name	Description	Allowed values	Default value
------	-------------	----------------	---------------

X-egain-session	Session ID obtained from Login API response header	N/A	N/A
Accept	Content type accepted by client	application/xml or application/json	N/A
Accept-Language	Language locale accepted by client (used for locale specific fields in resource representation and in error responses)	Supported 'Accept-Language' header codes	default system language

Supported API specific query parameters

None

Supported common query parameters

Refer to [Supported Common Query Parameters in ECE REST API](#) page for detailed description of each common parameter listed below.

- \$attribute - [Values of \\$attribute common parameter supported by Case Resource](#)
- \$sort - [Values of \\$sort common parameter supported by Case Resource](#)
- \$order

Response

Response headers

Name	Description	Possible values
X-egain-session	Session ID of the current user session	N/A
Content-Type	Media type of response body	application/xml or application/json

Response body xml schemas

- [Cases Schema](#) - used in case of success
- [Error](#) - used in case of error

Summary attributes always returned in server response

[Summary attributes of Case Resource](#)

Additional attributes returned in server response if explicitly requested by client

Server can be prompted to return additional attributes of resource representation using `$attribute` common query parameter. [Values of \\$attribute common parameter supported by Case Resource](#) for the list of allowed attribute names.

HTTP status codes

Success Status codes

200 - OK

- The request was successfully executed

Failure Status codes

400 - Bad Request

- Unsupported query or common parameter in request URL
- Invalid value of common parameter in request URL (e.g., unallowed value of `$order`, unsupported `$attribute` value etc.)
- `$order` provided without `$sort`
- More than 75 IDs are supplied in request URL

401 - Unauthorized

- X-egain-session request header is missing
- Session is invalid or expired

403 - Forbidden

- The user does not have sufficient permissions to view one or more of the requested resources

404 - Not Found

- One or more of the requested resource IDs does not exist

406 - Not Acceptable

- Invalid 'Accept-Language' header value

500 - Internal server error

Examples:

[Example 1 - Get summary attributes for a single case](#)

[Example 2 - Get all attributes for a single case](#)

[Example 3 - Get summary attributes and additional attributes for multiple cases](#)

[Example 4 - Get multiple cases sorted on department](#)

[Example 5 - Get multiple cases sorted on customer name](#)

GetCustomerAttributesExamples Class Reference

Detailed Description

Examples for Retrieve Customer Attribute Metadata

Example 1 - Get metadata for an attribute

This example demonstrates the following:

- Getting metadata for a single attribute. This example retrieves the details of the "type" attribute of the customer resource.

XML

Request

Method	URL
GET	/ws/v12/interaction/customer/attributes?\$attribute=type

Request headers

Name	Values
X-egain-session	valid session ID
Accept	application/xml
Accept-Language	en-US

Response:

HTTP/1.1 200 OK

Response headers

Name	Values
X-egain-session	current session ID
Content-Type	application/xml

Example 3 - Get metadata for all attributes

This example demonstrates the following:

- Getting the metadata for all the attributes of the customer resource.

XML

Request

Method	URL
GET	/ws/v12/interaction/customer/attributes?\$attribute=all

Request headers

Name	Values
X-egain-session	valid session ID
Accept	application/xml
Accept-Language	en-US

Response:

HTTP/1.1 200 OK

Response headers

Name	Values
X-egain-session	current session ID
Content-Type	application/xml

Response body

```

GetCustomerAttributesPage Class Reference

Detailed Description

Get Customer Attributes

Overview

This API allows a user to retrieve metadata for attributes of customer resource.

Since:

11.6

APIs

Method	URL	Description
GET	/ws/v12/interaction/customer/attributes	Retrieve attribute metadata for customer resource.

Authentication

Authentication is required. The client must be logged in to call this API. Each API request must contain X-egain-session request header returned by Login API.

Permissions

No permissions are required.

Licenses

The logged in user must have the following licenses:

- ECE CIH Platform

Request

Request headers

Name	Description	Allowed values	Default value
X-egain-session	Session ID obtained from Login API response header	N/A	N/A
Accept	Content type accepted by client	application/xml or application/json	N/A
Accept-Language	Language locale accepted by client	Supported 'Accept-Language'	default system language

	(used for locale specific fields in resource representation and in error responses)	header codes	
--	---	--------------	--

Supported API specific query parameters

None

Supported common query parameters

- \$attribute: Must be provided to get customer attributes. Refer to [Supported Common Query Parameters in ECE REST API](#) for details.

One of the following values must be provided for \$attribute query parameter:

- type: Returns metadata for type and region attributes of customer resource. The specific attributes are:
 - group.type: Available group types
 - group.region: Regions configured in application for the customer resource
 - corporate.region: Regions configured in application for corporate customer
- country: Returns the list of the countries configured in application.
- industry: Returns the list of the industries configured in application.
- level: Returns the list of the levels configured in application.
- contactPersons: Returns metadata for attributes of contactPersons. Metadata of the following attributes of contactPersons is returned:
 - contactPerson.type: Types of contact persons configured in the application.
 - contactPerson.identification.type: Types of identification for contact person configured in the application.
 - contactPerson.contactPoints.contactPoint: Metadata information of the custom attributes configured for a contact point in the application.
 - Custom attributes of the contact Person.
- custom: Returns the custom attributes configured for customer resource.
- all: This attribute has a special meaning. If this is specified, all the supported attributes are returned.

Response

Response headers

Name	Description	Possible values
X-egain-session	Session ID of the current user session	N/A
Content-Type	Media type of response body	application/xml or application/json

Response body

The response body can be in either XML or JSON format.

Response body XML schemas:

- [Attributes Schema](#) - used in case of success
- [Error](#) - used in case of error

HTTP status codes

Success Status codes

200 - OK

- The request executed successfully.

204 - No content

- No content to return. For example, if only custom attributes are requested, and no custom attributes are configured for the customer resource.

Failure Status codes

400 - Bad Request

- Unsupported query parameter is sent in request URL.
- Required common query parameter is not provided. Refer the section "Supported common query parameters" for more details.

401 - Unauthorized

- X-egain-session request header is missing.
- Session is invalid or expired.

406 - Not Acceptable

- Invalid 'Accept-Language' header value.

500 - Internal server error

Examples:

[Example 1 - Get metadata for an attribute](#)

[Example 2 - Get metadata for multiple attributes](#)

[Example 3 - Get metadata for all attributes](#)

GetCustomerGrantExamples Class Reference

Detailed Description

Examples for GET grants of a customer

Example 1 - Get grants of a customer

This example demonstrates the following:

- Retrieving the grants for logged in customer who has grants on other customers, and has given grants to other customers.

XML

Request

Method	URL
GET	/ws/v15/context/interaction/customer/grant

Request headers

Name	Value
X-egain-session	Valid session ID
Accept	application/xml
Accept-Language	en-US

Response

HTTP/1.1 200 OK

Response headers

Name	Value
X-egain-session	current session ID
Content-Type	application/xml

Response body

```
<?xml version="1.0" encoding="UTF-8" standalone="yes" ?><grants xmlns="http://bindings.egain.com/ws/model/v15/gen/interaction/customer"xmlns:ns2="http://bindings.egain.com/ws/model/v15/gen/interaction/case"xmlns:ns3="http://bindings.egain.com/ws/model/v15/gen/interaction/activity"xmlns:ns4="http://bindings.egain.com/ws/model/v15/gen/platform"xmlns:ns5="http://bindings.egain.com/ws/model/v15/gen/common"xmlns:ns6="http://bindings.egain.com/ws/model/v15/gen/interaction/folder"xmlns:ns7="http://bindings.egain.com/ws/model/v15/gen/interaction/attachment"xmlns:ns8="http://bindings.egain.com/ws/model/v15/gen/mail/alias"xmlns:ns9="http://bindings.egain.com/ws/model/v15/gen/live/entrypoint"xmlns:ns10="http://bindings.egain.com/ws/model/v15/gen/interaction/contactperson"xmlns:ns11="http://bindings.egain.com/ws/model/v15/gen/interaction/contactpoint"> <grantsOn> <customer id="1002"> <customerName>Kerry Simpson</customerName> </customer> </grantsOn> <grantsTo> <customer> <customerName>Jacob Marshall</customerName> </customer> </grantsTo></grants>
```

JSON

Request

Method	URL
GET	/ws/v15/interaction/customer/grant

Request headers

Name	Value
X-egain-session	Valid session ID
Accept	application/json
Accept-Language	en-US

Response

HTTP/1.1 200 OK

Response headers

Name	Value
X-egain-session	current session ID
Content-Type	application/json

Response body

```
{  "grantsOn": {    "customer": [      {        "customerName": "Kerry Simpson",        "id": 1002      }    ],    "grantsTo": {      "customerName": "Jacob Marshall"    }  }  }
```

```

GetCustomerGrantPage Class Reference

Detailed Description

Get customer grants

Overview

This API allows users to get the grants of a customer based on customer ID. The response will have all the grants.

Refer [Customer grants](#) for information about what is a grant.

Since:

11.6

APIs

Method	URL	Description
GET	/ws/v12/interaction/customer/{ID}/grant	Retrieve grants for a customer based on customer ID. {ID}: ID of the customer.

Authentication

Authentication is required. The client must be logged in to call this API. Each API request must contain X-egain-session request header returned by Login API.

Permissions

All of the following are required:

- 'View Agent Console' action.
- If "customer departmentalization" setting is enabled in the application, the customer specified through ID must belong to either the user's home department, or to a department where the user is a foreign user.

Licenses

The logged in user must have the following licenses:

- ECE CIH Platform

Request

Request headers

Name	Description	Allowed values	Default value
X-egain-session	Session ID obtained from Login API	N/A	N/A

	response header		
Accept	Content type accepted by client	application/xml or application/json	N/A
Accept-Language	Language locale accepted by client (used for locale specific fields in resource representation and in error responses)	Supported 'Accept-Language' header codes	default system language

Supported API specific query parameters

None

Supported common query parameters

None

Response

Response headers

Name	Description	Possible values
X-egain-session	Session ID of the current user session	N/A
Content-Type	Media type of response body	application/xml or application/json

Response body xml schemas

- [Grants Schema](#) - used in case of success
- [Error](#) - used in case of error

Summary attributes always returned in server response

[Summary attributes](#)

Additional attributes returned in server response if explicitly requested by client

None

HTTP status codes

Success Status codes

200 - OK

- The request was successfully executed, and the grants are returned in the response body

204 - No Content

- The request was successfully executed, and no grants were found for the customer.

Failure Status codes

400 - Bad Request

- Any query parameter is provided in request URL

401 - Unauthorized

- X-egain-session request header is missing.
- Session is invalid or expired.

403 - Forbidden

- The user does not have sufficient permissions. Refer [Permissions](#) section for details.

404 - Not Found

- The requested resource ID does not exist

406 - Not Acceptable

- Invalid 'Accept-Language' header value

500 - Internal server error

GetCustomerProfilePage Class Reference

Detailed Description

Get customer profile

Overview

This API can be used to get the details of the logged in customer.

Since:

11.6

APIs

Method	URL	Description
GET	/ws/v15/context/interaction/customer	Retrieve details of the logged in customer.

Authentication

Authentication is required. The customer must be logged in to call this API. Each API request must contain X-egain-session request header returned by Login API.

Permissions

- All authenticated customers can access this API.

Request

Request headers

Name	Description	Allowed values	Default value
X-egain-session	Session ID obtained from Login API response header	N/A	N/A
Accept	Content type accepted by client	application/xml or application/json	N/A
Accept-Language	Language locale accepted by client (used for locale specific fields in resource)	Supported 'Accept-Language' header codes	default system language

	representation and in error responses)		
--	--	--	--

Supported API specific query parameters

None

Supported common query parameters

Refer to [Supported Common Query Parameters in ECE REST API](#) page for detailed description of each common parameter listed below.

- \$attribute - [Values of \\$attribute common parameter supported by Customer Resource](#)

Response

Response headers

Name	Description	Possible values
X-egain-session	Session ID of the current user session	N/A
Content-Type	Media type of response body	application/xml or application/json

Response body xml schemas:

- [Customers Schema](#) - used in case of success
- [Error](#) - used in case of error

Summary attributes always returned in server response

See [Summary attributes of Customer Resource](#) for the list of summary attributes returned in server response.

NOTE: For customers with multiple contacts, all attributes are returned only for the logged in contact. For other contacts of the customer, only firstName and lastName attributes are returned.

Additional attributes returned in server response if explicitly requested by client

Server can be prompted to return additional attributes of resource representation using \$attribute common query parameter. [Values of \\$attribute common parameter supported by Customer Resource](#) for the list of allowed attribute names.

HTTP status codes

Success Status codes

200 - OK

- The request was successfully executed

Failure Status codes

400 - Bad Request

- Unsupported query parameter in the request
- Invalid value of common parameter in request URL (e.g. unsupported \$attribute value)

401 - Unauthorized

- X-egain-session request header is missing
- Session is invalid or expired

406 - Not Acceptable

- Invalid 'Accept-Language' header value

500 - Internal server error

Examples:

[Example 1 - Get summary attributes for the customer](#)

[Example 2 - Get summary attributes and additional attributes for the customer](#)

[Example 3 - Get all attributes for the customer](#)

GetCustomersByIdsPage Class Reference

Detailed Description

Get Customers by IDs

Overview

This API allows user to retrieve one or more customers identified by customer IDs. To provide multiple IDs, a comma separated string must be used in request URI. A maximum of 75 IDs is allowed per request. Neither pagination nor range query parameters are supported by this API.

Since:

11.6

APIs

Method	URL	Description
GET	/ws/v12/interaction/customer/{IDs}	Retrieve customers by their IDs. {IDs}: a comma separated string of customer IDs.

Authentication

Authentication is required. The client must be logged in to call this API. Each API request must contain X-egain-session request header returned by Login API.

Permissions

All of the following are required:

- 'View Agent Console' action.
- If "Customer departmentalization" setting is enabled, then each of the requested customers must belong to either the user's home department, or to the department where the user is a foreign user.

Licenses

The logged in user must have the following licenses:

- ECE CIH Platform

Request

Request headers

Name	Description	Allowed values	Default value
X-egain-session	Session ID obtained from Login API	N/A	N/A

	response header		
Accept	Content type accepted by client	application/xml or application/json	N/A
Accept-Language	Language locale accepted by client (used for locale specific fields in resource representation and in error responses)	Supported 'Accept-Language' header codes	default system language

Supported API specific query parameters

None

Supported common query parameters

Refer to [Supported Common Query Parameters in ECE REST API](#) page for detailed description of each common parameter listed below.

- \$attribute - [Values of \\$attribute common parameter supported by Customer Resource](#)
- \$sort - [Values of \\$sort common parameter supported by Customer Resource](#)
- \$order

Response

Response headers

Name	Description	Possible values
X-egain-session	Session ID of the current user session	N/A
Content-Type	Media type of response body	application/xml or application/json

Response body XML schemas

- [Customers Schema](#) - used in case of success
- [Error](#) - used in case of error

Summary attributes always returned in server response

[Summary attributes of Customer Resource](#)

Additional attributes returned in server response if explicitly requested by client

Server can be prompted to return additional attributes of resource representation using \$attribute common query parameter. [Values of \\$attribute common parameter supported by](#)

[Customer Resource](#) for the list of allowed attribute names.

HTTP status codes

Success Status codes

200 - OK

- The request was successfully executed

Failure Status codes

400 - Bad Request

- Unsupported query or common parameter in request URL
- Invalid value of common parameter in request URL (e.g., unallowed value of `$order` , unsupported `$attribute` value etc.)
- `$order` provided without `$sort`
- More than 75 IDs are supplied in request URL

401 - Unauthorized

- X-egain-session request header is missing
- Session is invalid or expired

403 - Forbidden

- The user does not have sufficient permissions to view one or more of the requested resources

404 - Not Found

- One or more of the requested resource IDs does not exist

406 - Not Acceptable

- Invalid 'Accept-Language' header value

500 - Internal server error

Examples:

[Example 1 - Get summary attributes of a single customer](#)

[Example 2 - Get multiple customers sorted on customerName](#)

[Example 3 - Get all attributes for multiple customers sorted on custom attribute](#)

[Example 4 - Get additional attributes for a single customer](#)

GetGrantForCustomerPage Class Reference

Detailed Description

Get customer grants

Overview

This API allows customers to retrieve the grants for self. The response will have all the grants provided by and provided to the customer.

Refer [Customer grants](#) for information about what is a grant.

Since:

11.6

APIs

Method	URL	Description
GET	/ws/v15/context/interaction/customer/grant	Retrieve grants for self

Authentication

Authentication is required. The customer must be logged in to call this API. Each API request must contain X-egain-session request header returned by Login API.

Permissions

- All authenticated customers can access this API.

Request

Request headers

Name	Description	Allowed values	Default value
X-egain-session	Session ID obtained from Login API response header	N/A	N/A
Accept	Content type accepted by client	application/xml or application/json	N/A
Accept-Language	Language locale accepted by client	Supported 'Accept-Language'	default system language

	(used for locale specific fields in resource representation and in error responses)	header codes	
--	---	--------------	--

Supported API specific query parameters

None

Supported common query parameters

None

Response

Response headers

Name	Description	Possible values
X-egain-session	Session ID of the current user session	N/A
Content-Type	Media type of response body	application/xml or application/json

Response body xml schemas

- [Grants Schema](#) - used in case of success
- [Error](#) - used in case of error

Summary attributes always returned in server response

[Summary attributes](#)

Additional attributes returned in server response if explicitly requested by client

None

HTTP status codes

Success Status codes

200 - OK

- The request was successfully executed, and the grants are returned in the response body

204 - No Content

- The request was successfully executed, and no grants were found for the customer.

Failure Status codes

400 - Bad Request

- Any query parameter is provided in request URL

401 - Unauthorized

- X-egain-session request header is missing.
- Session is invalid or expired.

406 - Not Acceptable

- Invalid 'Accept-Language' header value

500 - Internal server error

Examples:

[Example 1 - Get grants of a customer](#)

GetIssueTypeExamples Class Reference

Detailed Description

Examples for GET issueTypes for a Message Center

Example 1 - Get the issue types for a message center

This example demonstrates the following:

- Get the issue types for a given message center.

XML

Request

Method	URL
GET	/ws/v15/context/interaction/messagecenter/service/issuetype

Request headers

Name	Value
X-egain-session	Valid session ID
Accept	application/xml
Accept-Language	en-US

Response

HTTP/1.1 200 OK

Response headers

Name	Value
X-egain-session	current session ID
Content-Type	application/xml

Response body

```
<?xml version="1.0" encoding="UTF-8" standalone="yes" ?><issueTypes
xmlns="http://bindings.egain.com/ws/model/v15/gen/mail/issuetype">  <issueType id="1000">
<name>Screen Issue</name>      <allowUserCreatedSubject>true</allowUserCreatedSubject>
</issueType>  <issueType id="1001">      <name>Battery Issue</name>
<allowUserCreatedSubject>true</allowUserCreatedSubject>  </issueType></issueTypes>
```

JSON

Request

Method	URL
GET	/ws/v15/context/interaction/

	messagecenter/service/issuetype
--	---------------------------------

Request headers

Name	Value
X-egain-session	Valid session ID
Accept	application/json
Accept-Language	en-US

Response

HTTP/1.1 200 OK

Response headers

Name	Value
X-egain-session	current session ID
Content-Type	application/json

Response body

```
{  "issueType": [    {      "name": "Screen Issue",      "id": 1000    },    {      "name": "Battery Issue",      "allowUserCreatedSubject": true,      "id": 1001    }  ] }
```

Example 2 - Get all attributes of issue types for a message center

This example demonstrates the following:

- Get the issue types for a given message center.
- Get all supported attributes of an issue type. Since "subjects" is the only additional attribute that is supported, it is retrieved as part of the response.

XML

Request

Method	URL
GET	/ws/v15/context/interaction/messagecenter/service/issuetype?\$attribute=all

Request headers

Name	Value
X-egain-session	Valid session ID
Accept	application/xml
Accept-Language	en-US

Response

HTTP/1.1 200 OK

Response headers

Name	Value
X-egain-session	current session ID
Content-Type	application/xml

Response body

```
<?xml version="1.0" encoding="UTF-8" standalone="yes" ?><issueTypes
xmlns="http://bindings.egain.com/ws/model/v15/gen/mail/issuetype">  <issueType id="1000">
<name>Screen Issue</name>      <allowUserCreatedSubject>true</allowUserCreatedSubject>
<subjects>      <subject id="1000">      <name>Screen flickers</name>
</subject>      <subject id="1001">      <name>Broken screen</name>
</subject>      </subjects>  </issueType>  <issueType id="1001">      <name>Battery
Issue</name>      <allowUserCreatedSubject>true</allowUserCreatedSubject>      <subjects>
<subject id="1002">      <name>Charging takes time</name>      </subject>
<subject id="1003">      <name>Battery discharges fast</name>      </subject>
</subjects>  </issueType></issueTypes>
```

JSON

Request

Method	URL
GET	/ws/v15/context/interaction/messagecenter/service/issuetype?\$attribute=all

Request headers

Name	Value
X-egain-session	Valid session ID
Accept	application/json
Accept-Language	en-US

Response

HTTP/1.1 200 OK

Response headers

Name	Value
X-egain-session	current session ID
Content-Type	application/json

Response body

```

```

GetIssueTypePage Class Reference

Detailed Description

Get issue types for a message center

Overview

This API allows a customer to retrieve all issue types for a message center.

Since:

11.6

APIs

Method	URL	Description
GET	<code>/ws/v15/context/interaction/messagecenter/{ID}/issuetype</code>	Retrieve issue types configured for a message center based on message center ID.: ID of the message center

Authentication

Authentication is required. The customer must be logged in to call this API. Each API request must contain X-egain-session request header returned by Login API.

Permissions

- All authenticated customers can access this API.

Request

Request headers

Name	Description	Allowed values	Default value
X-egain-session	Session ID obtained from Login API response header	N/A	N/A
Accept	Content type accepted by client	application/xml or application/json	N/A
Accept-Language	Language locale accepted by client	Supported 'Accept-Language'	default system language

	(used for locale specific fields in resource representation and in error responses)	header codes	
--	---	--------------	--

Supported API specific query parameters

None

Supported common query parameters

Refer to [Supported Common Query Parameters in ECE REST API](#) page for detailed description of each common parameter listed below.

- \$attribute - [Values of \\$attribute common parameter supported by Issuetype Resource](#)

Response

Response headers

Name	Description	Possible values
X-egain-session	Session ID of the current user session	N/A
Content-Type	Media type of response body	application/xml or application/json

Response body xml schemas

- [IssueTypes Schema](#) - used in case of success
- [Error](#) - used in case of error

Summary attributes always returned in server response

[Summary attributes](#)

Additional attributes returned in server response if explicitly requested by client

Server can be prompted to return additional attributes of resource representation using \$attribute common query parameter. [Values of \\$attribute common parameter supported by Issuetype Resource](#) for the list of allowed attribute names.

HTTP status codes

Success Status codes

200 - OK

- The request executed successfully.

204 - No Content

- No content to return. This will happen if there are no issue types configured in the application for the message center.

Failure Status codes

400 - Bad Request

- Unsupported system query parameter is sent in the request.
- Any API specific query parameter is sent in the request.
- Invalid value of common parameter in request URL (e.g. unsupported \$attribute value)

401 - Unauthorized

- X-egain-session request header is missing.
- Session is invalid or expired.

404 - Not Found

- Message Center with the specified ID in the URI is not found.
- Customer departmentalization setting is enabled, and the message center with the specified ID in the URI is not found in the department of the customer.
- Message Center with the specified ID in the URI is disabled.

406 - Not Acceptable

- Invalid 'Accept-Language' header value

500 - Internal server error

Examples:

[Example 1 - Get the issue types for a message center](#)

[Example 2 - Get all attributes of issue types for a message center](#)

GetJsonExampleRequestHeadersSection Class Reference

Detailed Description

Request headers

Name	Value
X-egain-session	Valid session ID
Accept	application/json
Accept-Language	en-US

GetJsonExampleResponseHeadersSection Class Reference

Detailed Description

Response headers

Name	Value
X-egain-session	current session ID
Content-Type	application/json

GetSearchHttpStatusCodes Class Reference

Detailed Description

Success Status codes

200 - OK

- Matches are found for this search and returned in the response body.

204 - No Content

- No matches were found for given search criteria.
- Matches found for this search, however the requested page or range doesn't contain any results.

Failure Status codes

400 - Bad Request

- Unsupported query parameter is sent in the request.
- Unsupported value for query parameter is sent in the request.
- None of the API specific query parameter is provided (since at least one search criterion is required).
- Unsupported combination of common query parameters (\$order provided without \$sort, mixing of pagination and range parameters etc.).

401 - Unauthorized

- X-egain-session request header is missing.
- Session is invalid or expired.

403 - Forbidden

- The user does not have sufficient permissions. Refer the "Permissions" section for details.

406 - Not Acceptable

- Invalid 'Accept-Language' header value.

500 - Internal server error

GettingStarted Class Reference

Detailed Description

Before you begin working with ECE API it is important to understand some of its key characteristics.

Stateless

ECE REST APIs are stateless. All the necessary information to process a request is contained in the request itself. No context information is stored on the server to process the request. Statelessness improves the API performance, and allows better scalability for the application.

Layered

The REST architecture of ECE APIs allows the existence of intermediaries such as gateways, proxies, or load balancers between the client and the server to facilitate improved scalability and to enforce security policies.

Support for XML and JSON

ECE REST API supports both XML and JSON as the data format for requests and responses. The default format is XML.

Use the HTTP header `Accept:application/json` to select JSON or `Accept:application/xml` to select XML.

Date and Time format

Date and time information in requests and responses follows the [ISO 8601](#) format.

Authentication

ECE REST API supports session based authentication. To learn more about authentication refer [Understanding Authentication](#).

Compression

In order to improve performance, ECE API allows the use of compression on responses.

Response Compression

You can request compression on the responses by using the HTTP header `Accept-Encoding:gzip` in a request. The response is compressed if a client specifies this header in the request, and the response includes HTTP header `Content-Encoding:gzip` to indicate response compression

Request Compression

Compressing of requests is not supported at this time.

Optimized Responses

ECE API responses are optimized to minimize the network traffic. As a result, the response includes only a pre-defined set of attributes; the other parts of the resource are not included in the response unless explicitly requested. You can request additional attributes of a resource by using the `$attribute` query parameter.

Use the `$attribute` query parameter to specify a comma-separated list of additional attributes that you want in the response. For example, appending `$attributes=keywords,summary` to an

Article URI's request will result in inclusion of `keywords` and `summary` for the requested article. You can also use `$attributes=all`, a special construct, to request all the attributes of a resource.

Support for CORS

ECE REST API supports Cross-origin resource sharing (CORS). CORS is a mechanism that allows resources (e.g. fonts, JavaScript, etc.) on a web page to be requested from another domain outside the domain from which the resource originated.

You can configure a whitelist of the origins for ECE REST API from the ECE Administration Console.

GetXmlExampleRequestHeadersSection Class Reference

- void [setType](#) ([L10NString](#) value)

Detailed Description

GroupInfo Schema

Description of the elements used in [GroupInfo](#) schema.

XML Schema File

model/v15/xsd/interaction/customer.xsd

Name	Description	Type
type	type of group of the customer	String
region	Region of operation of the group customer	String
numberOfMembers	Number of members in the group	Long
income	Income of the group customer	String
currency	Currency used while dealing with the group customer	String
registrationNumber	Registration number of the group customer	String
affiliation	Affiliation of the group customer	String
contact	Contact details	ContactPerson

Member Function Documentation

java.lang.String getAffiliation ()

Gets the value of the affiliation property.

Returns:

possible object is [java.lang.String](#)

[ContactPerson](#) getContact ()

Gets the value of the contact property.

Returns:

possible object is [ContactPerson](#)

java.lang.String getCurrency ()

Gets the value of the currency property.

Returns:

possible object is [java.lang.String](#)

java.lang.String getIncome ()

Gets the value of the income property.

Returns:

possible object is [java.lang.String](#)

java.lang.String getNumberOfMembers ()

Gets the value of the numberOfMembers property.

Returns:

possible object is [java.lang.String](#)

java.lang.String getRegion ()

Gets the value of the region property.

Returns:

possible object is [java.lang.String](#)

java.lang.String getRegistrationNumber ()

Gets the value of the registrationNumber property.

Returns:

possible object is [java.lang.String](#)

[L10NString](#) getType ()

Gets the value of the type property.

Returns:

possible object is [L10NString](#)

void setAffiliation (java.lang.String value)

Sets the value of the affiliation property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setContact ([ContactPerson](#) *value*)

Sets the value of the contact property.

Parameters:

<i>value</i>	allowed object is ContactPerson
--------------	---

void setCurrency (java.lang.String *value*)

Sets the value of the currency property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setIncome (java.lang.String *value*)

Sets the value of the income property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setNumberOfMembers (java.lang.String *value*)

Sets the value of the numberOfMembers property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setRegion (java.lang.String *value*)

Sets the value of the region property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setRegistrationNumber (java.lang.String *value*)

Sets the value of the registrationNumber property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setType ([L10NString](#) *value*)

Sets the value of the type property.

Parameters:

<i>value</i>	allowed object is L10NString
--------------	--

void setType ([L10NString](#) *value*)

Sets the value of the type property.

Parameters:

<i>value</i>	allowed object is L10NString
--------------	--

HideActivitiesExamples Class Reference

Detailed Description

Examples for hide activities

Example 1 - Hide single activity

This example demonstrates the following:

- Hiding a single activity belonging to logged in customer.

XML

Request

Method	URL
DELETE	/ws/v15/context/interaction/activity/1011

Request headers

Name	Values
X-egain-session	valid session ID
Accept	application/xml
Accept-Language	en-US

Response:

HTTP/1.1 204 No Content

Response headers

Name	Values
X-egain-session	current session ID
Content-Type	application/xml

JSON

Request

Method	URL
DELETE	/ws/v15/context/interaction/activity/1011

Request headers

Name	Values
X-egain-session	valid session ID
Accept	application/json
Accept-Language	en-US

Response:

HTTP/1.1 204 No Content

Response headers

Name	Values
X-egain-session	current session ID
Content-Type	application/json

Example 2 - Hide multiple activities

This example demonstrates the following:

- Hiding multiple activities belonging to logged in customer.

XML

Request

Method	URL
DELETE	/ws/v15/context/interaction/activity/1011,1012,1015

Request headers

Name	Values
X-egain-session	valid session ID
Accept	application/xml
Accept-Language	en-US

Response:

HTTP/1.1 204 No Content

Response headers

Name	Values
X-egain-session	current session ID
Content-Type	application/xml

JSON

Request

Method	URL
DELETE	/ws/v15/context/interaction/activity/1011,1012,1015

Request headers

Name	Values
X-egain-session	valid session ID
Accept	application/json
Accept-Language	en-US

Response:

HTTP/1.1 204 No Content

Response headers

Name	Values
X-egain-session	current session ID
Content-Type	application/json

HideActivitiesPage Class Reference

Detailed Description

Hide activities

Overview

This API can be used to hide one or more activities of a customer.

For this API to execute successfully:

- The activities must be visible to the customer. Refer the page [Activities visible to a customer](#) for more information.
- Not more than 75 activity IDs must be sent in one request.

NOTE: Once hidden, the activity will never be visible to the customer again. The action cannot be reverted.

Since:

11.6

APIs

Method	URL	Description
DELETE	/ws/v15/context/interaction/activity/{IDs}	Hide one or more activities. {IDs}: a comma separated string of activity IDs to be hidden.

Authentication

Authentication is required. The customer must be logged in to call this API. Each API request must contain X-egain-session request header returned by Login API.

Permissions

- All authenticated customers can access this API.
- Only activities visible to the customer can be hidden (refer the [Overview](#) section for details). If the customer cannot view the activity, the application will return 404 response code.

Request

Request headers

Name	Description	Allowed values	Default value
X-egain-session	Session ID obtained from Login API	N/A	N/A

	response header		
Accept	Content type accepted by client	application/xml or application/json	N/A
Accept-Language	Language locale accepted by client (used for locale specific fields in resource representation and in error responses)	Supported 'Accept-Language' header codes	default system language

Request Body

Request body is not allowed.

Supported API specific query parameters

None

Supported common query parameters

None

Response

Response headers

Name	Description	Possible values
X-egain-session	Session ID of the current user session	N/A
Content-Type	Media type of response body	application/xml or application/json

Response Body

The response body will be sent only in case of error. It can be in either XML or JSON format.

Response body xml schemas:

- [Error](#) - used in case of error

HTTP status codes

Success Status codes

204 - No Content

- Activities have been successfully hidden.

Failure Status codes

400 - Bad Request

- Any query parameter is sent in the request.
- More than 75 activity IDs must be sent in the request URI.

401 - Unauthorized

- X-egain-session request header is missing
- Session is invalid or expired

404 - Not Found

- One or more activity IDs specified in the request were not found.
- One or more activity IDs specified in the request is not visible to the logged in customer.

406 - Not Acceptable

- Invalid 'Accept-Language' header value

500 - Internal server error

Examples:

[Example 1 - Hide single activity](#)

[Example 2 - Hide multiple activities](#)

This schema contains the details of Identity provider.

XML Schema File

model/v3/xsd/common.xsd

Name	Description	Type
samlRequest	SAML Request Token for Single Sign On.	string
idpLoginURL	Identity provider login URL for Single Sign On.	string
idpLogoutURL	Identity provider logout URL for Single Sign On.	string

Member Function Documentation

java.lang.String getIdpLoginURL ()

Gets the value of the idpLoginURL property.

Returns:

possible object is [java.lang.String](#)

java.lang.String getIdpLogoutURL ()

Gets the value of the idpLogoutURL property.

Returns:

possible object is [java.lang.String](#)

java.lang.String getSamlRequest ()

Gets the value of the samlRequest property.

Returns:

possible object is [java.lang.String](#)

void setIdpLoginURL (java.lang.String value)

Sets the value of the idpLoginURL property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setIdpLogoutURL (java.lang.String value)

Sets the value of the idpLogoutURL property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setSamlRequest (java.lang.String value)

Sets the value of the samlRequest property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

IdType Class Reference

Public Member Functions

- long [getId](#) ()
 - IdType.Link [getLink](#) ()
 - void [setId](#) (long value)
 - void [setLink](#) (IdType.Link value)
-

Detailed Description

Documentation to be added when the Authoring API is released.

Member Function Documentation

long getId ()

Gets the value of the id property.

Returns:

possible object is [Long](#)

IdType.Link getLink ()

Gets the value of the link property.

Returns:

possible object is [IdType.Link](#)

void setId (long value)

Sets the value of the id property.

Parameters:

<i>value</i>	allowed object is Long
--------------	--

void setLink (IdType.Link value)

Sets the value of the link property.

Parameters:

<i>value</i>	allowed object is IdType.Link
--------------	---

Detailed Description

Issue Type Schema

This schema contains the definition of an issue type for secure inbox.

XML Schema File

model/v15/xsd/mail/issue_type.xsd

Name	Description	Type
id	ID of the issue type.	Long
name	Name of the issue type.	String
description	Description of the Issue Type.	String
allowUserCreatedSubject	Field to convey if user created subject is allowed for this issue type	Boolean
subjects	Subjects configured for the issue type.	Subjects

Member Function Documentation

java.lang.String getDescription ()

Gets the value of the description property.

Returns:

possible object is [java.lang.String](#)

long getId ()

Gets the value of the id property.

Returns:

possible object is [Long](#)

java.lang.String getName ()

Gets the value of the name property.

Returns:

possible object is [java.lang.String](#)

[Subjects](#) getSubjects ()

Gets the value of the subjects property.

Returns:

possible object is [Subjects](#)

Boolean isAllowUserCreatedSubject ()

Gets the value of the allowUserCreatedSubject property.

Returns:

possible object is [Boolean](#)

void setAllowUserCreatedSubject (Boolean value)

Sets the value of the allowUserCreatedSubject property.

Parameters:

<i>value</i>	allowed object is Boolean
--------------	---

void setDescription (java.lang.String value)

Sets the value of the description property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setId (long value)

Sets the value of the id property.

Parameters:

<i>value</i>	allowed object is Long
--------------	--

void setName (java.lang.String value)

Sets the value of the name property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setSubjects ([Subjects](#) value)

Sets the value of the subjects property.

Parameters:

<i>value</i>	allowed object is Subjects
--------------	--

Detailed Description

Issue Type Schema

This schema contains the definition of an issue type for secure inbox.

XML Schema File

model/v12/xsd/mail/issue_type.xsd

Name	Description	Type
id	ID of the issue type.	Long
name	Name of the issue type.	String
description	Description of the Issue Type.	String
created	Creation details of the issue type	DateAndUser
lastModified	Last modification details of the issue type	DateAndUser
allowUserCreatedSubject	Field to convey if user created subject is allowed for this issue type	Boolean
subjects	Subjects configured for the issue type.	Subjects
order	Order of the issue type if configured to message center.	Integer

Member Function Documentation

[DateAndUser](#) `getCreated ()`

Gets the value of the created property.

Returns:

possible object is [DateAndUser](#)

`java.lang.String` `getDescription ()`

Gets the value of the description property.

Returns:

possible object is [java.lang.String](#)

`long` `getId ()`

Gets the value of the id property.

Returns:

possible object is [Long](#)

[DateAndUser](#) `getLastModified ()`

Gets the value of the lastModified property.

Returns:

possible object is [DateAndUser](#)

`java.lang.String` `getName ()`

Gets the value of the name property.

Returns:

possible object is [java.lang.String](#)

`BigInteger` `getOrder ()`

Gets the value of the order property.

Returns:

possible object is [BigInteger](#)

[Subjects](#) `getSubjects ()`

Gets the value of the subjects property.

Returns:

possible object is [Subjects](#)

`Boolean` `isAllowUserCreatedSubject ()`

Gets the value of the allowUserCreatedSubject property.

Returns:

possible object is [Boolean](#)

`void` `setAllowUserCreatedSubject (Boolean value)`

Sets the value of the allowUserCreatedSubject property.

Parameters:

<i>value</i>	allowed object is Boolean
--------------	---

void setCreated ([DateAndUser](#) *value*)

Sets the value of the created property.

Parameters:

<i>value</i>	allowed object is DateAndUser
--------------	---

void setDescription ([java.lang.String](#) *value*)

Sets the value of the description property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setId ([long](#) *value*)

Sets the value of the id property.

Parameters:

<i>value</i>	allowed object is Long
--------------	--

void setLastModified ([DateAndUser](#) *value*)

Sets the value of the lastModified property.

Parameters:

<i>value</i>	allowed object is DateAndUser
--------------	---

void setName ([java.lang.String](#) *value*)

Sets the value of the name property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setOrder ([BigInteger](#) *value*)

Sets the value of the order property.

Parameters:

<i>value</i>	allowed object is BigInteger
--------------	--

void setSubjects ([Subjects](#) *value*)

Sets the value of the subjects property.

Parameters:

<i>value</i>	allowed object is Subjects
--------------	--

IssueTypeCommonInfo Class Reference

Detailed Description

Supported values of some Common Query Parameters that appear in Issuetype Resource APIs

NOTE: Each *common parameter* described below is not necessarily supported by all Issuetype APIs. Therefore, first refer to specific API documentation to see which *common parameters* that API supports.

Values of \$attribute common parameter supported by Issuetype Resource

Use \$attribute to request additional attributes/elements of resource representation, beyond those always returned by server. The value of \$attribute must be a comma separated list of attribute names. For example,

GET
.../context/interaction/messagecenter/id/issuetype?\$attribute=all

GET
.../context/interaction/messagecenter/id/issuetype?\$attribute=subjects

Name	Description	Schema/type
all	This is a special keyword that prompts server to return all available resource attributes	N/A
subjects	Subjects configured for the issue type. For each configured subject, its id and name will be returned.	Subjects

Summary attributes of Issuetype Resource

Issuetype Resource always returns '<issuetypes>' representation, that contains one or more '<issuetype>' representations.

Issuetype Summary

Name	Description	Schema/type
id	Issue Type ID	Long
name	Name of the issue type	String
description	Description of the issue type	String
allowUserCreatedSubject	Name of the issue type	Boolean

IssueTypes Class Reference

Public Member Functions

- `java.util.List<IssueType> getIssueType ()`
-

Detailed Description

IssueTypes Schema

This schema contains [IssueTypes](#) type details.

XML Schema File

`model/v15/xsd/mail/issue_type.xsd`

Name	Description	Type
<code>issueType</code>	Issue Type details	<code>IssueType</code>

Member Function Documentation

`java.util.List<IssueType> getIssueType ()`

Gets the value of the `issueType` property.

This accessor method returns a reference to the live list, not a snapshot. Therefore any modification you make to the returned list will be present inside the JAXB object. This is why there is not a `set` method for the `issueType` property.

For example, to add a new item, do as follows:

```
getIssueType ().add(newItem);
```

Objects of the following type(s) are allowed in the list [IssueType](#)

IssueTypes Class Reference

Public Member Functions

Detailed Description

Documentation to be added when the Authoring API is released.

Member Function Documentation

java.lang.String [getAttachmentName](#) ()

Gets the value of the attachmentName property.

Returns:

possible object is [java.lang.String](#)

short [getAttachmentType](#) ()

Gets the value of the attachmentType property.

void [setAttachmentName](#) (java.lang.String *value*)

Sets the value of the attachmentName property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void [setAttachmentType](#) (short *value*)

Sets the value of the attachmentType property.

Detailed Description

L10NString Schema

This schema contains details of the [L10NString](#) schema.

XML Schema File

model/v12/xsd/common.xsd

Name	Description	Type
value	A string that indicates the value.	String
displayValue	Localized string of the value element.	String

Member Function Documentation

java.lang.String [getDisplayValue](#) ()

Gets the value of the displayValue property.

Returns:

possible object is [java.lang.String](#)

java.lang.String [getValue](#) ()

Gets the value of the value property.

Returns:

possible object is [java.lang.String](#)

void [setDisplayValue](#) (java.lang.String value)

Sets the value of the displayValue property.

Parameters:

value	allowed object is java.lang.String
-------	--

void [setValue](#) (java.lang.String value)

Sets the value of the value property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

L10NString Class Reference

L10NString Schema

This schema contains details of the [L10NString](#) schema.

XML Schema File

model/v15/xsd/common.xsd

Name	Description	Type
value	A string that indicates the value.	String
displayValue	Localized string of the value element.	String

Member Function Documentation

java.lang.String [getDisplayValue](#) ()

Gets the value of the displayValue property.

Returns:

possible object is [java.lang.String](#)

java.lang.String [getValue](#) ()

Gets the value of the value property.

Returns:

possible object is [java.lang.String](#)

void [setDisplayValue](#) (java.lang.String value)

Sets the value of the displayValue property.

Parameters:

value	allowed object is java.lang.String
-------	--

void [setValue](#) (java.lang.String value)

Sets the value of the value property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

Language Class Reference

Language Schema

This schema contains [Language](#) type details.

XML Schema File

model/v15/xsd/platform/language.xsd

Name	Description	Type
id	ID of the language	Long
code	Language code. For E.g: en-us is the language code for English for Unites States	String
label	Label for the language	String

Member Function Documentation

java.lang.String getCode ()

Gets the value of the code property.

Returns:

possible object is [java.lang.String](#)

int getId ()

Gets the value of the id property.

Returns:

possible object is [Integer](#)

java.lang.String getLabel ()

Gets the value of the label property.

Returns:

possible object is [java.lang.String](#)

void setCode (java.lang.String *value*)

Sets the value of the code property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setId (int *value*)

Sets the value of the id property.

Parameters:

<i>value</i>	allowed object is Integer
--------------	---

void setLabel (java.lang.String *value*)

Sets the value of the label property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

base="{http://www.w3.org/2001/XMLSchema}anyType"> <sequence> <element name="linkage"
type="{http://bindings.egain.com/ws/model/v12/gen/platform}Linkage" maxOccurs="unbounded"/>
</sequence> </restriction> </complexContent></complexType>
```

Member Function Documentation

`java.util.List<Linkage> getLinkage ()`

Gets the value of the linkage property.

This accessor method returns a reference to the live list, not a snapshot. Therefore any modification you make to the returned list will be present inside the JAXB object. This is why there is not a `set` method for the linkage property.

For example, to add a new item, do as follows:

```
getLinkage ().add(newItem);
```

Objects of the following type(s) are allowed in the list [Linkage](#)

Lock Class Reference

Public Member Functions

- [User](#) `getLockedBy` ()
 - void `setLockedBy` ([User](#) value)
-

Detailed Description

Lock Schema

This schema contains [Lock](#) type details.

XML Schema File

model/v12/xsd/kb/article.xsd

Name	Description	Type
lockedBy	Details of the user who has checked out the article	User

Member Function Documentation

[User](#) `getLockedBy` ()

Gets the value of the lockedBy property.

Returns:

possible object is [User](#)

void `setLockedBy` ([User](#) value)

Sets the value of the lockedBy property.

Parameters:

<i>value</i>	allowed object is User
--------------	--

Login Class Reference

Public Member Functions

- java.lang.String [getPassword](#) ()
 - java.lang.String [getUserName](#) ()
 - void [setPassword](#) (java.lang.String value)
 - void [setUserName](#) (java.lang.String value)
-

Detailed Description

Login Schema

Description of the elements used in [Login](#) schema.

XML Schema File

model/v15/xsd/kb/login.xsd

Name	Description	Type
userName	Login user name	String
password	Password for the above user name	String

Member Function Documentation

java.lang.String getPassword ()

Gets the value of the password property.

Returns:

possible object is [java.lang.String](#)

java.lang.String getUserName ()

Gets the value of the userName property.

Returns:

possible object is [java.lang.String](#)

void setPassword (java.lang.String value)

Sets the value of the password property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setUserName (java.lang.String value)

Sets the value of the userName property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

Login Class Reference

Detailed Description

Login Schema

Description of the elements used in [Login](#) schema.

XML Schema File

model/v12/xsd/kb/login.xsd

Name	Description	Type
userName	Login user name	String
password	Password for the above user name	String

Member Function Documentation

java.lang.String getPassword ()

Gets the value of the password property.

Returns:

possible object is [java.lang.String](#)

java.lang.String getUserName ()

Gets the value of the userName property.

Returns:

possible object is [java.lang.String](#)

void setPassword (java.lang.String value)

Sets the value of the password property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setUserName (java.lang.String value)

Sets the value of the userName property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

Logout Class Reference

 - void [setSpAuthenticationEnabled](#) (boolean value)
-

Detailed Description

Logout Schema

Description of the elements used in [Logout](#) schema.

XML Schema File

model/v15/xsd/platform/logout.xsd

Name	Description	Type
spAuthenticationEnabled	Flag to indicate if SP authentication is enabled for customers	Boolean
idpLogoutUrl	Identity provider logout URL (returned only if SP authenticated SSO is enabled for customer)	String
samlRequest	Logout SAML Token (returned only if SP authenticated SSO is enabled for customer)	String
providers	Details of configured providers in the application.	Providers

Member Function Documentation

java.lang.String getIdpLogoutUrl ()

Gets the value of the idpLogoutUrl property.

Returns:

possible object is [java.lang.String](#)

[Providers](#) getProviders ()

Gets the value of the providers property.

Returns:

possible object is [Providers](#)

java.lang.String getSamlRequest ()

Gets the value of the samlRequest property.

Returns:

possible object is [java.lang.String](#)

boolean isSpAuthenticationEnabled ()

Gets the value of the spAuthenticationEnabled property.

void setIdpLogoutUrl (java.lang.String value)

Sets the value of the idpLogoutUrl property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setProviders ([Providers](#) value)

Sets the value of the providers property.

Parameters:

<i>value</i>	allowed object is Providers
--------------	---

void setSamlRequest (java.lang.String value)

Sets the value of the samlRequest property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setSpAuthenticationEnabled (boolean value)

Sets the value of the spAuthenticationEnabled property.

Name	Description	Type
name	Name of the macro	String
description	Description of the macro	String
defaultArticle	Default article with the macro	String
defaultValue	Default value of macro .	String

Member Function Documentation

java.lang.String getDefaultArticle ()

Gets the value of the defaultArticle property.

Returns:

possible object is [java.lang.String](#)

java.lang.String getDefaultValue ()

Gets the value of the defaultValue property.

Returns:

possible object is [java.lang.String](#)

java.lang.String getDescription ()

Gets the value of the description property.

Returns:

possible object is [java.lang.String](#)

java.lang.String getName ()

Gets the value of the name property.

Returns:

possible object is [java.lang.String](#)

void setDefaultArticle (java.lang.String value)

Sets the value of the defaultArticle property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setDefaultValue (java.lang.String value)

Sets the value of the defaultValue property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setDescription (java.lang.String value)

Sets the value of the description property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setName (java.lang.String value)

Sets the value of the name property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setDescription (java.lang.String value)

Sets the value of the description property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setName (java.lang.String value)

Sets the value of the name property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

MarkActivitiesReadPage Class Reference

Detailed Description

Mark activities as read

Overview

This API can be used to mark one or more activities of a customer as read.

For this API to execute successfully:

- The activities must be visible to the customer. Refer the page [Activities visible to a customer](#) for more information.
- Not more than 75 activity IDs must be sent in one request.

NOTE: This API will be successful even if the activities are already in "read" state.

Since:

11.6

APIs

Method	URL	Description
PUT	/ws/v15/context/interaction/activity/{IDs}/read	Mark one or more activities as read. {IDs}: a comma separated string of activity IDs to be marked as read.

Authentication

Authentication is required. The customer must be logged in to call this API. Each API request must contain X-egain-session request header returned by Login API.

Permissions

- All authenticated customers can access this API.
- Only activities visible to the customer can be marked as read (refer the [Overview](#) section for details). If the customer cannot view the activity, the application will return 404 response code.

Request

Request headers

Name	Description	Allowed values	Default value
X-egain-session	Session ID obtained from Login API	N/A	N/A

	response header		
Accept	Content type accepted by client	application/xml or application/json	N/A
Accept-Language	Language locale accepted by client (used for locale specific fields in resource representation and in error responses)	Supported 'Accept-Language' header codes	default system language

Request Body

Request body is not allowed.

Supported API specific query parameters

None

Supported common query parameters

None

Response

Response headers

Name	Description	Possible values
X-egain-session	Session ID of the current user session	N/A
Content-Type	Media type of response body	application/xml or application/json

Response Body

The response body will be sent only in case of error. It can be in either XML or JSON format.

Response body xml schemas:

- [Error](#) - used in case of error

HTTP status codes

Success Status codes

204 - No Content

- Activities have been marked as read successfully.

Failure Status codes

400 - Bad Request

- Any query parameter is sent in the request.
- More than 75 activity IDs must be sent in the request URI.

401 - Unauthorized

- X-egain-session request header is missing
- Session is invalid or expired

404 - Not Found

- One or more activity IDs specified in the request were not found.
- One or more activity IDs specified in the request is not visible to the logged in customer.

406 - Not Acceptable

- Invalid 'Accept-Language' header value

500 - Internal server error

Examples:

[Example 1 - Mark single activity as read](#)

[Example 2 - Mark multiple activities as read](#)

MarkActivitiesUnreadPage Class Reference

Detailed Description

Mark activities as unread

Overview

This API can be used to mark one or more activities of a customer as unread.

For this API to execute successfully:

- The activities must be visible to the customer. Refer the page [Activities visible to a customer](#) for more information.
- Not more than 75 activity IDs must be sent in one request.

NOTE: This API will be successful even if the activities are already in "unread" state.

Since:

11.6

APIs

Method	URL	Description
PUT	/ws/v15/context/interaction/activity/{IDs}/unread	Mark one or more activities as unread. {IDs}: a comma separated string of activity IDs to be marked as unread.

Authentication

Authentication is required. The customer must be logged in to call this API. Each API request must contain X-egain-session request header returned by Login API.

Permissions

- All authenticated customers can access this API.
- Only activities visible to the customer can be marked as unread (refer the [Overview](#) section for details). If the customer cannot view the activity, the application will return 404 response code.

Request

Request headers

Name	Description	Allowed values	Default value
X-egain-session	Session ID obtained from Login API	N/A	N/A

	response header		
Accept	Content type accepted by client	application/xml or application/json	N/A
Accept-Language	Language locale accepted by client (used for locale specific fields in resource representation and in error responses)	Supported 'Accept-Language' header codes	default system language

Request Body

Request body is not allowed.

Supported API specific query parameters

None

Supported common query parameters

None

Response

Response headers

Name	Description	Possible values
X-egain-session	Session ID of the current user session	N/A
Content-Type	Media type of response body	application/xml or application/json

Response Body

The response body will be sent only in case of error. It can be in either XML or JSON format.

Response body xml schemas:

- [Error](#) - used in case of error

HTTP status codes

Success Status codes

204 - No Content

- Activities have been marked as unread successfully.

Failure Status codes

400 - Bad Request

- Any query parameter is sent in the request.
- More than 75 activity IDs must be sent in the request URI.

401 - Unauthorized

- X-egain-session request header is missing
- Session is invalid or expired

404 - Not Found

- One or more activity IDs specified in the request were not found.
- One or more activity IDs specified in the request is not visible to the logged in customer.

406 - Not Acceptable

- Invalid 'Accept-Language' header value

500 - Internal server error

Examples:

[Example 1 - Mark single activity as unread](#)

[Example 2 - Mark multiple activities as unread](#)

MarkActivityReadExamples Class Reference

Detailed Description

Examples for mark activites as read

Example 1 - Mark single activity as read

This example demonstrates the following:

- Marking a single activity belonging to logged in customer as read.

XML

Request

Method	URL
PUT	/ws/v15/context/interaction/activity/1011/read

Request headers

Name	Values
X-egain-session	valid session ID
Accept	application/xml
Accept-Language	en-US

Response:

HTTP/1.1 204 No Content

Response headers

Name	Values
X-egain-session	current session ID
Content-Type	application/xml

JSON

Request

Method	URL
PUT	/ws/v15/context/interaction/activity/1011/read

Request headers

Name	Values
X-egain-session	valid session ID
Accept	application/json
Accept-Language	en-US

Response:

HTTP/1.1 204 No Content

Response headers

Name	Values
X-egain-session	current session ID
Content-Type	application/json

Example 2 - Mark multiple activities as read

This example demonstrates the following:

- Marking multiple activities belonging to logged in customer as read.

XML

Request

Method	URL
PUT	/ws/v15/context/interaction/activity/1011,1012,1015/read

Request headers

Name	Values
X-egain-session	valid session ID
Accept	application/xml
Accept-Language	en-US

Response:

HTTP/1.1 204 No Content

Response headers

Name	Values
X-egain-session	current session ID
Content-Type	application/xml

JSON

Request

Method	URL
PUT	/ws/v15/context/interaction/activity/1011,1012,1015/read

Request headers

Name	Values
X-egain-session	valid session ID
Accept	application/json
Accept-Language	en-US

Response:

HTTP/1.1 204 No Content

Response headers

Name	Values
X-egain-session	current session ID
Content-Type	application/json

MarkActivityUnreadExamples Class Reference

Detailed Description

Examples for mark activites as unread

id	ID of the message center.	Long

Member Function Documentation

BigInteger [getAllowedTypeOfEmails](#) ()

Gets the value of the allowedTypeOfEmails property.

Returns:

possible object is [BigInteger](#)

[DateAndUser](#) getCreated ()

Gets the value of the created property.

Returns:

possible object is [DateAndUser](#)

[Department](#) getDepartment ()

Gets the value of the department property.

Returns:

possible object is [Department](#)

java.lang.String getId ()

Gets the value of the id property.

Returns:

possible object is [java.lang.String](#)

[IssueTypes](#) getIssueTypes ()

Gets the value of the issueTypes property.

Returns:

possible object is [IssueTypes](#)

[DateAndUser](#) getLastModified ()

Gets the value of the lastModified property.

Returns:

possible object is [DateAndUser](#)

long getMessageCenterId ()

Gets the value of the messageCenterId property.

Returns:

possible object is [Long](#)

Notification getNotification ()

Gets the value of the notification property.

Returns:

possible object is [Notification](#)

[Department](#) getOldDepartment ()

Gets the value of the oldDepartment property.

Returns:

possible object is [Department](#)

Boolean isEnabled ()

Gets the value of the enable property.

Returns:

possible object is [Boolean](#)

void setAllowedTypeOfEmails (BigInteger value)

Sets the value of the allowedTypeOfEmails property.

Parameters:

<i>value</i>	allowed object is BigInteger
--------------	--

void setCreated ([DateAndUser](#) value)

Sets the value of the created property.

Parameters:

<i>value</i>	allowed object is DateAndUser
--------------	---

void setDepartment ([Department](#) value)

Sets the value of the department property.

Parameters:

<i>value</i>	allowed object is Department
--------------	--

void setEnable (Boolean value)

Sets the value of the enable property.

Parameters:

<i>value</i>	allowed object is Boolean
--------------	---

void setId (java.lang.String value)

Sets the value of the id property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setIssueTypes ([IssueTypes](#) value)

Sets the value of the issueTypes property.

Parameters:

<i>value</i>	allowed object is IssueTypes
--------------	--

void setLastModified ([DateAndUser](#) value)

Sets the value of the lastModified property.

Parameters:

<i>value</i>	allowed object is DateAndUser
--------------	---

void setMessageCenterId (long value)

Sets the value of the messageCenterId property.

Parameters:

<i>value</i>	allowed object is Long
--------------	--

void setNotification (Notification value)

Sets the value of the notification property.

Parameters:

<i>value</i>	allowed object is Notification
--------------	--

void setOldDepartment ([Department](#) *value*)

Sets the value of the oldDepartment property.

Parameters:

<i>value</i>	allowed object is Department
--------------	--

MoveContactPointsPage Class Reference

Detailed Description

Move Contact Points

Overview

This API allows users to move one or more contact points of a single contact person to a different contact person. Target contact person ID must be specified in the request body.

All activities (including completed activities) and all cases associated with the contact points listed in the URI, are updated to reflect the changes in customer, contact persons and contact points.

Criteria for successful execution

- All contact points listed in the request URI must belong to the same contact person.
- Contact points can only move across different contact persons belonging to different customers. Hence, contact person of the contact points listed in the URI should belong to a customer different from target contact persons's customer.
- If the customer is departmentalized, the department of the customer of contact points listed in the URI and the department of the target customer should be the same.
- Number of contact points specified in the request URI should not exceed 75.

Since:

11.6

APIs

Method	URL	Description
PUT	/ws/v12/interaction/customer/contactperson/contactpoint/{IDs}/move	Move contact points specified by IDs to target contact person specified in the request body. {IDs} represent a comma separated string of contact point IDs.

Authentication

Authentication is required. The client must be logged in to call this API. Each API request must contain X-again-session request header returned by Login API.

Permissions

All of the following are required:

- 'Edit Customer' action.

- All the activities associated with the contact points in the URI should belong to either the user's home department, or to the department where the user is a foreign user.

Licenses

The logged in user must have the following licenses:

- ECE CIH Platform

Request

Request headers

Name	Description	Allowed values	Default value
X-egain-session	Session ID obtained from Login API response header	N/A	N/A
Accept	Content type accepted by client.	application/xml or application/json	N/A
Content-Type	Media type sent by the client	application/xml or application/json	N/A
Accept-Language	Language locale accepted by client (used for locale specific fields in resource representation and in error responses)	Supported 'Accept-Language' header codes	default system language

Required elements to be submitted in the request body

Name	Description	Type
customer.contactpersons.contactperson.id	Target contact person ID	Long

Optional elements allowed to be submitted in the request body

No optional elements in request body are supported by this API.

Request body xml schemas

- [Customer Schema](#) - used to send target contact person ID.

Supported API specific query parameters

No query parameter is supported by this API.

Supported common query parameters

No common query parameter is supported by this API.

Response

Response headers

Name	Description	Possible values
X-egain-session	Session ID of the current user session	N/A
Content-Type	Media type of response body	application/xml or application/json

Events logged

- 401 (change customer event for every activity updated)
- 402 (move contact point event for every contact point moved)

HTTP status codes

Success Status codes

204 - No Content

- Contact Points successfully moved.

Failure Status codes

400 - Bad Request

- Any query or common parameter is present in the request URL.
- Request body does not contain the required elements for moving contact points.
- Any element present in the request body is not a supported required or optional element.
- More than one target contact person is listed in the request body.
- Contact person in the request body does not exist.
- Request body is empty.
- Any criteria for successful execution mentioned in the Overview section is violated.

401 - Unauthorized

- X-egain-session request header is missing
- Session is invalid or expired

403 - Forbidden

- The user does not have sufficient permissions to move one or more of the requested resources.

404 - Not Found

- One or more contact point IDs, provided in the URI, do not exist.

406 - Not Acceptable

- Invalid 'Accept-Language' header value.

409 - Conflict

- One or more activities associated with any contact point IDs sent in the URI are locked by another user.

500 - Internal server error

Examples

All examples listed below assume that following are true:

- The user has the required permissions. See *Permissions* section for more info.
- All activities associated to the contact points moved, are updated to reflect the changes.

Example 1

This example demonstrates how to move a single contact point of a contact person to another contact person.

Request

Request body

```
{ "contactPersons": { "contactPerson": [ { "id": 1003 } ] }}
```

Response headers

Name	Value
X-egain-session	current session ID
Content-Type	application/json

Example 2

This example demonstrates how to move three contact points of a contact person to another contact person.

Request

Method	URL
PUT	ws/v12/interaction/customer/contactperson/contactpoint/1004,1002,1003/move

Response:

HTTP/1.1 204 No Content

XML

Request headers

Name	Value
X-egain-session	Valid session ID
Accept	application/xml
Content-Type	application/xml
Accept-Language	en-US

Request body

```
<?xml version="1.0" encoding="UTF-8" standalone="yes"?><customer xmlns="http://bindings.egain.com/ws/model/v12/gen/interaction/customer" xmlns:ns1="http://bindings.egain.com/ws/model/v12/gen/interaction/contactperson"><contactPersons><ns1:contactPerson id="1003"/></contactPersons></customer>
```

Response headers

Name	Value
X-egain-session	current session ID
Content-Type	application/xml

JSON

Request headers

Name	Value
X-egain-session	Valid session ID
Accept	application/json
Content-Type	application/json
Accept-Language	en-US

Request body

```
{ "contactPersons": { "contactPerson": [ { "id": 1003 } ] }}
```

Response headers

Name	Value
X-egain-session	current session ID
Content-Type	application/json

XML Schema File

model/v12/xsd/interaction/activity.xsd

Name	Description	Type
name	Name of the network attribute parameter	String
value	Value of the network attribute parameter	String

Member Function Documentation

java.lang.String getName ()

Gets the value of the name property.

Returns:

possible object is [java.lang.String](#)

java.lang.String getValue ()

Gets the value of the value property.

Returns:

possible object is [java.lang.String](#)

void setName (java.lang.String value)

Sets the value of the name property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setValue (java.lang.String value)

Sets the value of the value property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

Member Function Documentation

java.lang.String getName ()

Gets the value of the name property.

Returns:

possible object is [java.lang.String](#)

java.lang.String getValue ()

Gets the value of the value property.

Returns:

possible object is [java.lang.String](#)

void setName (java.lang.String value)

Sets the value of the name property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setValue (java.lang.String value)

Sets the value of the value property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

NetworkAttributes Class Reference

Public Member Functions

- `java.util.List<NetworkAttribute> getNetworkAttribute ()`
-

Detailed Description

NetworkAttributes Schema

This schema defines [NetworkAttributes](#) specific to a social network.

XML Schema File

`model/v12/xsd/interaction/activity.xsd`

Name	Description	Type
<code>networkAttribute</code>	List of network attributes specific to social network	NetworkAttribute

Member Function Documentation

`java.util.List<NetworkAttribute> getNetworkAttribute ()`

Gets the value of the `networkAttribute` property.

This accessor method returns a reference to the live list, not a snapshot. Therefore any modification you make to the returned list will be present inside the JAXB object. This is why there is not a `set` method for the `networkAttribute` property.

For example, to add a new item, do as follows:

```
getNetworkAttribute ().add (newItem) ;
```

Objects of the following type(s) are allowed in the list [NetworkAttribute](#)

NetworkAttributes Class Reference

Public Member Functions

XML Schema File

model/v15/xsd/common.xsd

Name	Description	Type
content	Text of the note, should be of CDATA type	String
created	Creation details of the note	DateAndUser
id	ID of the note	Long

Member Function Documentation

java.lang.String [getContent](#) ()

Gets the value of the content property.

Returns:

possible object is [java.lang.String](#)

[DateAndUser](#) [getCreated](#) ()

Gets the value of the created property.

Returns:

possible object is [DateAndUser](#)

long [getId](#) ()

Gets the value of the id property.

Returns:

possible object is [Long](#)

void setContent (java.lang.String value)

Sets the value of the content property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setCreated ([DateAndUser](#) value)

Sets the value of the created property.

Parameters:

<i>value</i>	allowed object is DateAndUser
--------------	---

void setId (long value)

Sets the value of the id property.

Parameters:

<i>value</i>	allowed object is Long
--------------	--

- [Folder](#) `getFolder ()`
 - [User](#) `getUser ()`
 - void `setFolder (Folder value)`
 - void `setUser (User value)`
-

Detailed Description

Owner Schema

This schema contains [Owner](#) type details.

XML Schema File

model/v15/xsd/interaction/case.xsd

Name	Description	Type
user	Details of the user who owns the case	User
folder	Folder details of the case	Folder

Member Function Documentation

[Folder](#) `getFolder ()`

Gets the value of the folder property.

Returns:

possible object is [Folder](#)

[User](#) `getUser ()`

Gets the value of the user property.

Returns:

possible object is [User](#)

void `setFolder (Folder value)`

Sets the value of the folder property.

Parameters:

<i>value</i>	allowed object is Folder
--------------	--

void `setUser (User value)`

Sets the value of the user property.

Parameters:

<i>value</i>	allowed object is User
--------------	--

PaginationInfo Class Reference

Public Member Functions

- int [getCount](#) ()
- java.util.List< [Link](#) > [getLink](#) ()
- int [getPagenum](#) ()
- int [getPagesize](#) ()
- void [setCount](#) (int value)
- void [setPagenum](#) (int value)
- void [setPagesize](#) (int value)

Detailed Description

PaginationInfo Schema

This schema contains [PaginationInfo](#) type details.

XML Schema File

model/v15/xsd/common.xsd

Name	Description	Type
count	Total number	Int
pagenum	Page number requested	Int
pagesize	Number of notes requested per page	Int
link	Can be prev , next link	Link

Member Function Documentation

int [getCount](#) ()

Gets the value of the count property.

java.util.List<[Link](#)> [getLink](#) ()

Gets the value of the link property.

This accessor method returns a reference to the live list, not a snapshot. Therefore any modification you make to the returned list will be present inside the JAXB object. This is why there is not a set method for the link property.

For example, to add a new item, do as follows:

```
getLink\(\).add(newItem);
```

Objects of the following type(s) are allowed in the list [Link](#)

int getPagenum ()

Gets the value of the pagenum property.

int getPagesize ()

Gets the value of the pagesize property.

void setCount (int *value*)

Sets the value of the count property.

void setPagenum (int *value*)

Sets the value of the pagenum property.

void setPagesize (int *value*)

Sets the value of the pagesize property.

 - void [setMaxRange](#) (int value)
 - void [setPageNumber](#) (int value)
 - void [setRangeSize](#) (int value)
 - void [setRangeStart](#) (int value)
-

Detailed Description

Paging Schema

This schema contains information about the page of data returned and the number of items on the page.

XML Schema File

model/v3/xsd/common.xsd

Name	Description	Type
count	The number of resource items (for example, articles or topics) returned in this response.	int
maxRange	The total number of resource items that could be returned. For example, if 614 articles match a search query but only the first ten results are returned, the maxRange value will be 614.	int
pageNumber	The page number of results returned. The first page of results is page 1.	int
rangeStart	The index of the first result returned. The index starts at 0. For example, if the third page of results is returned and the page size is 10, rangeStart will be 20 because the page 1 range is 0-9, the page 2 range is 10-19, and the page 3 range is 20-29.	int
rangeSize	This is the same as the page	int

	size, if paging is used. This will be equal to the count field, if the number available is greater than or equal to the page size. For example, if page size is 10 and there are only 7 results, count will be 7 and rangeSize will be 10.	
--	--	--

Member Function Documentation

int getCount ()

Gets the value of the count property.

int getMaxRange ()

Gets the value of the maxRange property.

int getPageNumber ()

Gets the value of the pageNumber property.

int getRangeSize ()

Gets the value of the rangeSize property.

int getRangeStart ()

Gets the value of the rangeStart property.

void setCount (int *value*)

Sets the value of the count property.

void setMaxRange (int *value*)

Sets the value of the maxRange property.

void setPageNumber (int *value*)

Sets the value of the pageNumber property.

void setRangeSize (int *value*)

Sets the value of the rangeSize property.

void setRangeStart (int *value*)

Sets the value of the rangeStart property.

 - `void` [setValue](#) (`java.lang.String` *value*)
-

Detailed Description

Parameter Schema

This schema contains one form parameter defined by its name and value.

XML Schema File

`model/v3/xsd/common.xsd`

Name	Description	Type
<code>name</code>	The name of the form parameter.	<code>string</code>
<code>value</code>	The value of the form parameter.	<code>string</code>

Member Function Documentation

`java.lang.String` [getName](#) ()

Gets the value of the name property.

Returns:

possible object is [java.lang.String](#)

`java.lang.String` [getValue](#) ()

Gets the value of the value property.

Returns:

possible object is [java.lang.String](#)

`void` [setName](#) (`java.lang.String` *value*)

Sets the value of the name property.

Parameters:

<code><i>value</i></code>	allowed object is java.lang.String
---------------------------	--

`void` [setValue](#) (`java.lang.String` *value*)

Sets the value of the value property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

Parent Class Reference

Public Member Functions

- long [getId](#) ()
 - void [setId](#) (long value)
-

Detailed Description

Parent Schema

This schema contains an ID that refers to a parent of an item.

XML Schema File

model/v3/xsd/common.xsd

Name	Description	Type
id	The ID of the parent.	long

Member Function Documentation

long getId ()

Gets the value of the id property.

void setId (long value)

Sets the value of the id property.

Name	Description	Type
email	This will have the attributes for the email activity.	EmailAttributes
chat	This will have the attributes for the chat activity.	ChatAttributes
web	This will have the attributes for the web activity.	WebAttributes
social	This will have the attributes for the social activity.	SocialAttributes
task	This will have the attributes for the task activity.	GenericActivityAttributes
calltrack	This will have the attributes for the calltrack activity.	GenericActivityAttributes
userCreated	This will have the attributes for any of the user created activity types.	GenericActivityAttributes

Member Function Documentation

[GenericActivityAttributes](#) getCalltrack ()

Gets the value of the calltrack property.

Returns:

possible object is [GenericActivityAttributes](#)

[ChatAttributes](#) getChat ()

Gets the value of the chat property.

Returns:

possible object is [ChatAttributes](#)

[EmailAttributes](#) getEmail ()

Gets the value of the email property.

Returns:

possible object is [EmailAttributes](#)

[SocialAttributes](#) getSocial ()

Gets the value of the social property.

Returns:

possible object is [SocialAttributes](#)

[GenericActivityAttributes](#) getTask ()

Gets the value of the task property.

Returns:

possible object is [GenericActivityAttributes](#)

[GenericActivityAttributes](#) getUserCreated ()

Gets the value of the userCreated property.

Returns:

possible object is [GenericActivityAttributes](#)

[WebAttributes](#) getWeb ()

Gets the value of the web property.

Returns:

possible object is [WebAttributes](#)

void setCalltrack ([GenericActivityAttributes](#) value)

Sets the value of the calltrack property.

Parameters:

<i>value</i>	allowed object is GenericActivityAttributes
--------------	---

void setChat ([ChatAttributes](#) value)

Sets the value of the chat property.

Parameters:

<i>value</i>	allowed object is ChatAttributes
--------------	--

void setEmail ([EmailAttributes](#) *value*)

Sets the value of the email property.

Parameters:

<i>value</i>	allowed object is EmailAttributes
--------------	---

void setSocial ([SocialAttributes](#) *value*)

Sets the value of the social property.

Parameters:

<i>value</i>	allowed object is SocialAttributes
--------------	--

void setTask ([GenericActivityAttributes](#) *value*)

Sets the value of the task property.

Parameters:

<i>value</i>	allowed object is GenericActivityAttributes
--------------	---

void setUserCreated ([GenericActivityAttributes](#) *value*)

Sets the value of the userCreated property.

Parameters:

<i>value</i>	allowed object is GenericActivityAttributes
--------------	---

void setWeb ([WebAttributes](#) *value*)

Sets the value of the web property.

Parameters:

<i>value</i>	allowed object is WebAttributes
--------------	---

Member Function Documentation

[GenericActivityAttributes](#) getCalltrack ()

Gets the value of the calltrack property.

Returns:

possible object is [GenericActivityAttributes](#)

[ChatAttributes](#) getChat ()

Gets the value of the chat property.

Returns:

possible object is [ChatAttributes](#)

[EmailAttributes](#) getEmail ()

Gets the value of the email property.

Returns:

possible object is [EmailAttributes](#)

[SocialAttributes](#) getSocial ()

Gets the value of the social property.

Returns:

possible object is [SocialAttributes](#)

[GenericActivityAttributes](#) getTask ()

Gets the value of the task property.

Returns:

possible object is [GenericActivityAttributes](#)

[GenericActivityAttributes](#) getUserCreated ()

Gets the value of the userCreated property.

Returns:

possible object is [GenericActivityAttributes](#)

[WebAttributes](#) getWeb ()

Gets the value of the web property.

Returns:

possible object is [WebAttributes](#)

void setCalltrack ([GenericActivityAttributes](#) value)

Sets the value of the calltrack property.

Parameters:

<i>value</i>	allowed object is GenericActivityAttributes
--------------	---

void setChat ([ChatAttributes](#) value)

Sets the value of the chat property.

Parameters:

<i>value</i>	allowed object is ChatAttributes
--------------	--

void setEmail ([EmailAttributes](#) *value*)

Sets the value of the email property.

Parameters:

<i>value</i>	allowed object is EmailAttributes
--------------	---

void setSocial ([SocialAttributes](#) *value*)

Sets the value of the social property.

Parameters:

<i>value</i>	allowed object is SocialAttributes
--------------	--

void setTask ([GenericActivityAttributes](#) *value*)

Sets the value of the task property.

Parameters:

<i>value</i>	allowed object is GenericActivityAttributes
--------------	---

void setUserCreated ([GenericActivityAttributes](#) *value*)

Sets the value of the userCreated property.

Parameters:

<i>value</i>	allowed object is GenericActivityAttributes
--------------	---

void setWeb ([WebAttributes](#) *value*)

Sets the value of the web property.

Parameters:

<i>value</i>	allowed object is WebAttributes
--------------	---

PermissionTypes Enum Reference

Detailed Description

Phone Schema

Definition of [Phone](#) contact point schema.

XML Schema File

model/v12/xsd/interaction/contact_point.xsd

Name	Description	Type
id	contact point ID	Long
type	Type of phone contact point	L10NString
phoneNo	Phone number of the phone contact point	String
countryCode	Country code of the phone contact point	String
areaCode	Area code of the phone contact point	String
extension	Extension of the phone contact point	String
availability	Availability details of the phone contact point	Availability
lastModified	Last modification details of the contact point	DateAndUser

Member Function Documentation

java.lang.String getAreaCode ()

Gets the value of the areaCode property.

Returns:

possible object is [java.lang.String](#)

[Availability](#) getAvailability ()

Gets the value of the availability property.

Returns:

possible object is [Availability](#)

java.lang.String getCountryCode ()

Gets the value of the countryCode property.

Returns:

possible object is [java.lang.String](#)

java.lang.String getExtension ()

Gets the value of the extension property.

Returns:

possible object is [java.lang.String](#)

long getId ()

Gets the value of the id property.

Returns:

possible object is [Long](#)

[DateAndUser](#) getLastModified ()

Gets the value of the lastModified property.

Returns:

possible object is [DateAndUser](#)

java.lang.String getPhoneNo ()

Gets the value of the phoneNo property.

Returns:

possible object is [java.lang.String](#)

[L10NString](#) getType ()

Gets the value of the type property.

Returns:

possible object is [L10NString](#)

void setAreaCode (java.lang.String value)

Sets the value of the areaCode property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setAvailability ([Availability](#) *value*)

Sets the value of the availability property.

Parameters:

<i>value</i>	allowed object is Availability
--------------	--

void setCountryCode (java.lang.String *value*)

Sets the value of the countryCode property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setExtension (java.lang.String *value*)

Sets the value of the extension property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setId (long *value*)

Sets the value of the id property.

Parameters:

<i>value</i>	allowed object is Long
--------------	--

void setLastModified ([DateAndUser](#) *value*)

Sets the value of the lastModified property.

Parameters:

<i>value</i>	allowed object is DateAndUser
--------------	---

void setPhoneNo (java.lang.String *value*)

Sets the value of the phoneNo property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setType ([L10NString](#) *value*)

Sets the value of the type property.

Parameters:

<i>value</i>	allowed object is L10NString
--------------	--

Detailed Description

Phone Schema

Definition of [Phone](#) contact point schema.

XML Schema File

model/v15/xsd/interaction/contact_point.xsd

Name	Description	Type
id	contact point ID	Long
type	type of phone contact point	L10NString
phoneNo	Phone number of the phone contact point	String
countryCode	Country code of the phone contact point	String
areaCode	Area code of the phone contact point	String
extension	Extension of the phone contact point	String
availability	Availability details of the phone contact point	Availability
lastModified	Last modification details of the contact point	DateAndUser

Member Function Documentation

java.lang.String getAreaCode ()

Gets the value of the areaCode property.

Returns:

possible object is [java.lang.String](#)

[Availability](#) getAvailability ()

Gets the value of the availability property.

Returns:

possible object is [Availability](#)

java.lang.String getCountryCode ()

Gets the value of the countryCode property.

Returns:

possible object is [java.lang.String](#)

java.lang.String getExtension ()

Gets the value of the extension property.

Returns:

possible object is [java.lang.String](#)

long getId ()

Gets the value of the id property.

Returns:

possible object is [Long](#)

[DateAndUser](#) getLastModified ()

Gets the value of the lastModified property.

Returns:

possible object is [DateAndUser](#)

java.lang.String getPhoneNo ()

Gets the value of the phoneNo property.

Returns:

possible object is [java.lang.String](#)

[L10NString](#) getType ()

Gets the value of the type property.

Returns:

possible object is [L10NString](#)

void setAreaCode (java.lang.String value)

Sets the value of the areaCode property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setAvailability ([Availability](#) *value*)

Sets the value of the availability property.

Parameters:

<i>value</i>	allowed object is Availability
--------------	--

void setCountryCode (java.lang.String *value*)

Sets the value of the countryCode property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setExtension (java.lang.String *value*)

Sets the value of the extension property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setId (long *value*)

Sets the value of the id property.

Parameters:

<i>value</i>	allowed object is Long
--------------	--

void setLastModified ([DateAndUser](#) *value*)

Sets the value of the lastModified property.

Parameters:

<i>value</i>	allowed object is DateAndUser
--------------	---

void setPhoneNo (java.lang.String *value*)

Sets the value of the phoneNo property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setType ([L10NString](#) *value*)

Sets the value of the type property.

Parameters:

<i>value</i>	allowed object is L10NString
--------------	--

PickActivityExamples Class Reference

Detailed Description

Examples for pick activities

Example 1 - Pick an activity

This example demonstrates the following:

- Picking a single activity.

XML

Request

Method	URL
PUT	/ws/v12/interaction/activity/pick

Request headers

Name	Value
X-egain-session	Valid session ID
Accept	application/xml
Content-Type	application/xml
Accept-Language	en-US

Request body:

```
<?xml version="1.0" encoding="UTF-8"?><activities xmlns="http://bindings.egain.com/ws/model/v12/gen/interaction/activity"> <activity id="1217"> <lastModified date="2014-11-24T09:09:08.000Z" /> </activity></activities>
```

Response:

HTTP/1.1 204 No Content

Response headers

Name	Value
X-egain-session	current session ID
Content-Type	application/xml

JSON

Request

Method	URL
PUT	/ws/v12/interaction/activity

	/pick
--	-------

Request headers

Name	Value
X-egain-session	Valid session ID
Accept	application/json
Content-Type	application/json
Accept-Language	en-US

Request body:

```
{ "activity": { "id": "1217", "lastModified": { "date": "2014-11-24T09:09:08.000Z" } } }
```

Response:

HTTP/1.1 204 No Content

Response headers

Name	Value
X-egain-session	current session ID
Content-Type	application/json

Example 2 - Pick multiple activities

This example demonstrates the following:

- Picking multiple activities. In this example, two activities are picked.
- Using the "unpin" query parameter.

XML

Request

Method	URL
PUT	/ws/v12/interaction/activity/pick?unpin=yes

Request headers

Name	Value
X-egain-session	Valid session ID
Accept	application/xml
Content-Type	application/xml
Accept-Language	en-US

Request body:

```
<?xml version="1.0" encoding="UTF-8"?><activities xmlns="http://bindings.egain.com/ws/model/v12/gen/interaction/activity"> <activity id="1217">
```

```
<lastModified date="2014-11-24T09:09:08.000Z" /> </activity> <activity id="1220">
<lastModified date="2014-12-20T09:16:40.000Z" /> </activity></activities>
```

Response:

HTTP/1.1 204 No Content

Response headers

Name	Value
X-egain-session	current session ID
Content-Type	application/xml

JSON

Request

Method	URL
PUT	/ws/v12/interaction/activity/pick?unpin=yes

Request headers

Name	Value
X-egain-session	Valid session ID
Accept	application/json
Content-Type	application/json
Accept-Language	en-US

Request body:

```
{ "activity": [ { "id": "1217", "lastModified": { "date": "2014-11-24T09:09:08.000Z" } }, { "id": "1220", "lastModified": { "date": "2014-12-20T09:16:40.000Z" } } ] }
```

Response:

HTTP/1.1 204 No Content

Response headers

Name	Value
X-egain-session	current session ID
Content-Type	application/json

model/v15/xsd/interaction/contact_point.xsd

Name	Description	Type
id	contact point ID	Long
type	type of postal contact point	L10NString
completeAddress	Complete address of the postal contact point	String
address_1	Address line 1 of the postal contact point	String
address_2	Address line 2 of the postal contact point	String
city	City of the postal contact point	String
state	State of the postal contact point	String

zip	Zip code of the postal contact point	String
country	Country of the postal contact point	String
region	Region of the postal contact point	String
lastModified	Last modification details of the contact point	DateAndUser

Member Function Documentation

java.lang.String getAddress1 ()

Gets the value of the address1 property.

Returns:

possible object is [java.lang.String](#)

java.lang.String getAddress2 ()

Gets the value of the address2 property.

Returns:

possible object is [java.lang.String](#)

java.lang.String getCity ()

Gets the value of the city property.

Returns:

possible object is [java.lang.String](#)

java.lang.String getCompleteAddress ()

Gets the value of the completeAddress property.

Returns:

possible object is [java.lang.String](#)

java.lang.String getCountry ()

Gets the value of the country property.

Returns:

possible object is [java.lang.String](#)

long getId ()

Gets the value of the id property.

Returns:

possible object is [Long](#)

DateAndUser getLastModified ()

Gets the value of the lastModified property.

Returns:

possible object is [DateAndUser](#)

java.lang.String getRegion ()

Gets the value of the region property.

Returns:

possible object is [java.lang.String](#)

java.lang.String getState ()

Gets the value of the state property.

Returns:

possible object is [java.lang.String](#)

L10NString getType ()

Gets the value of the type property.

Returns:

possible object is [L10NString](#)

java.lang.String getZip ()

Gets the value of the zip property.

Returns:

possible object is [java.lang.String](#)

void setAddress1 (java.lang.String value)

Sets the value of the address1 property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setAddress2 (java.lang.String value)

Sets the value of the address2 property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setCity (java.lang.String value)

Sets the value of the city property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setCompleteAddress (java.lang.String value)

Sets the value of the completeAddress property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setCountry (java.lang.String value)

Sets the value of the country property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setId (long value)

Sets the value of the id property.

Parameters:

<i>value</i>	allowed object is Long
--------------	--

void setLastModified ([DateAndUser](#) value)

Sets the value of the lastModified property.

Parameters:

<i>value</i>	allowed object is DateAndUser
--------------	---

void setRegion (java.lang.String value)

Sets the value of the region property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setState (java.lang.String value)

Sets the value of the state property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setType ([L10NString](#) value)

Sets the value of the type property.

Parameters:

<i>value</i>	allowed object is L10NString
--------------	--

void setZip (java.lang.String value)

Sets the value of the zip property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

Profile Class Reference

Public Member Functions

- java.lang.String [getAlternateId](#) ()
 - long [getId](#) ()
 - java.lang.String [getName](#) ()
 - void [setAlternateId](#) (java.lang.String value)
 - void [setId](#) (long value)
 - void [setName](#) (java.lang.String value)
-

Detailed Description

Profile

This schema contains information about [Profile](#).

XML Schema File

model/v15/xsd/kb/profile.xsd

Name	Description	Type
id *	ID of the Profile .	Long
alternateId *	Readable Id of the Profile .	String
name	Name of Profile .	String

Note : In XML response, items marked with * are returned as XML attributes while others are returned as XML elements.

Member Function Documentation

java.lang.String getAlternateId ()

Gets the value of the alternateId property.

Returns:

possible object is [java.lang.String](#)

long getId ()

Gets the value of the id property.

Returns:

possible object is [Long](#)

java.lang.String getName ()

Gets the value of the name property.

Returns:

possible object is [java.lang.String](#)

void setAlternateId (java.lang.String value)

Sets the value of the alternateId property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setId (long value)

Sets the value of the id property.

Parameters:

<i>value</i>	allowed object is Long
--------------	--

void setName (java.lang.String value)

Sets the value of the name property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

Profiles Class Reference

Public Member Functions

- [Language](#) `getLanguage ()`
- `java.util.List< Profile > getProfile ()`
- `void setLanguage (Language value)`

Detailed Description

Profiles

This schema contains information about [Profiles](#).

XML Schema File

`model/v15/xsd/kb/profile.xsd`

Name	Description	Type
<code>profile</code>	One or more instances of Profile .	Profile
<code>language</code>	Language	Language Schema

Member Function Documentation

[Language](#) `getLanguage ()`

Gets the value of the language property.

Returns:

possible object is [Language](#)

`java.util.List<Profile> getProfile ()`

Gets the value of the profile property.

This accessor method returns a reference to the live list, not a snapshot. Therefore any modification you make to the returned list will be present inside the JAXB object. This is why there is not a `set` method for the profile property.

For example, to add a new item, do as follows:

```
getProfile().add(newItem);
```

Objects of the following type(s) are allowed in the list [Profile](#)

`void setLanguage (Language value)`

Sets the value of the language property.

Parameters:

<code>value</code>	allowed object is Language
--------------------	--

Provider Class Reference

Public Member Functions

-

Detailed Description

Provider Schema

This schema contains the details of provider.

XML Schema File

model/v3/xsd/common.xsd

Name	Description	Type
idp	Details of the Identity provider.	IDP
default	Indicates if provider is default or not.	boolean
id	Identifier of provider.	string

Member Function Documentation

java.lang.String getId ()

Gets the value of the id property.

Returns:

possible object is [java.lang.String](#)

[IDP](#) getIdp ()

Gets the value of the idp property.

Returns:

possible object is [IDP](#)

Boolean isDefault ()

Gets the value of the default property.

Returns:

possible object is [Boolean](#)

void setDefault (Boolean *value*)

Sets the value of the default property.

Parameters:

<i>value</i>	allowed object is Boolean
--------------	---

void setId (java.lang.String *value*)

Sets the value of the id property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setIdp ([IDP](#) *value*)

Sets the value of the idp property.

Parameters:

<i>value</i>	allowed object is IDP
--------------	---------------------------------------

XML Schema File

model/v15/xsd/common.xsd

Name	Description	Type
idp	Details of the Identity provider.	IDP
default	Indicates if provider is default or not.	Boolean
id	Identifier of provider.	String

Member Function Documentation

java.lang.String getId ()

Gets the value of the id property.

Returns:

possible object is [java.lang.String](#)

[IDP](#) getIdp ()

Gets the value of the idp property.

Returns:

possible object is [IDP](#)

Boolean isDefault ()

Gets the value of the default property.

Returns:

possible object is [Boolean](#)

void setDefault (Boolean *value*)

Sets the value of the default property.

Parameters:

<i>value</i>	allowed object is Boolean
--------------	---

void setId (java.lang.String *value*)

Sets the value of the id property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setIdp ([IDP](#) *value*)

Sets the value of the idp property.

Parameters:

<i>value</i>	allowed object is IDP
--------------	---------------------------------------

Providers Class Reference

Public Member Functions

- `java.util.List<Provider> getProvider ()`
-

Detailed Description

Providers Schema

This schema contains a list of configured providers in the application.

XML Schema File

`model/v3/xsd/common.xsd`

Name	Description	Type
<code>provider</code>	Details of a configured provider.	Provider

Member Function Documentation

`java.util.List<Provider> getProvider ()`

Gets the value of the provider property.

This accessor method returns a reference to the live list, not a snapshot. Therefore any modification you make to the returned list will be present inside the JAXB object. This is why there is not a `set` method for the provider property.

For example, to add a new item, do as follows:

```
getProvider ().add(newItem);
```

Objects of the following type(s) are allowed in the list [Provider](#)

Providers Class Reference

X-egain-session	Valid session ID
Accept	application/json
Accept-Language	en-US

Request body

Request body is not allowed.

Response

HTTP/1.1 204 No Content

Response headers

Name	Value
X-egain-session	current session ID
Content-Type	application/json

PullActivitiesPage Class Reference

Detailed Description

Pull Activities

Overview

This API can be used by the logged in users to pull activities from queues. Unlike the Pick operation (where the user chooses specific activities to pick for work), the Pull operation pulls and assigns activities to the user according to the "Pull Options" configured in the Agent Console.

Chat type of activities cannot be pulled using this API.

For this API to execute successfully:

- User must have configured at least one queue in the "Pull Options".
-

As part of completing this request:

- User load is not considered, i.e., activities will be assigned to the logged in user regardless of the user's existing work load.
- Number of activities pulled depends upon the value configured in user setting "Maximum activities to pull". If the configured queues do not have sufficient activities, the actual number of activities pulled may be less than the configured value.
- Email activities will be pulled only if logged in user has ECE Mail license.
- Task and Generic activities will be pulled only if logged in user has ECE CIH Platform license.

Since:

11.6

APIs

Method	URL	Description
PUT	/ws/v12/interaction/activity/pull	Pull activities in status "in queue waiting to be assigned".

Authentication

Authentication is required. The client must be logged in to call this API. Each API request must contain X-again-session request header returned by Login API.

Permissions

- User must have 'Pull Activities' action.

- User must have 'Pull Activities' permission on at least one of the queues configured in the "Pull Options".

Licenses

The logged in user must have the following licenses:

- ECE CIH Platform

Request

Request headers

Name	Description	Allowed values	Default value
X-egain-session	Session ID obtained from Login API response header	N/A	N/A
Accept	Content type accepted by the client. Used for success and error response both.	application/xml or application/json	N/A
Accept-Language	Language locale accepted by client (used for locale specific fields in resource representation and in error responses)	Supported 'Accept-Language' header codes	default system language

Request Body

Request body is not allowed.

Supported API specific query parameters

None

Supported common query parameters

None

Response

Response headers

Name	Description	Possible values
X-egain-session	ID of the current user session	N/A
Content-Type	Media type of response body	application/xml or application/json

Response Body

Response body will be present if the request is successful and at least one activity is pulled. The response body can be in either XML or JSON format.

Elements sent in the response body

'activities' element will be present in the response body. At least one 'activity' element will be present in the 'activities' element. Each 'activity' element will contain the following elements:

Name	Description
id	ID of the activity pulled.
link	Self link of the activity pulled.

Response body XML schemas:

- [Activity Schema](#)
- [Error](#) - used in case of error

HTTP status codes

Success Status codes

200 - OK

- Successfully pulled the activities.

204 - No Content

- Successfully executed the request, but there were no activities available to pull.

Failure Status codes

400 - Bad Request

- Any query parameter is sent in the request.
- Any criteria for successful execution mentioned in the [Overview](#) section is violated.
- A request body is sent as part of the request

401 - Unauthorized

- X-egain-session request header is missing.
- Session is invalid or expired.

403 - Forbidden

- If the user does not have the appropriate permissions for this operation. Refer the [Permissions](#) section.

406 - Not Acceptable

- Invalid 'Accept-Language' header value.

500 - Internal server error

Examples:

[Example 1 - Pull activities when activities are available to pull](#)

[Example 2 - Pull activities when no activities are available to pull](#)

PutChangeCasePage Class Reference

Detailed Description

Change Case of Activities

Overview

This API can be used to change the case of one or more open activities of the same case. The target case can be a new case or an existing case.

For this API to execute successfully:

- All activities must exist in the application.
- All activities must belong to the same case and the case must exist in the application.
- The status of all activities in the request must be "in queue waiting to be assigned" or "assigned to a user".
- The customer associated with both the original and the target case must be the same.
- If the target case is an existing case, the case ID must be an existing case ID.
- If a response exists for any of the activities in the request body, they must be in "Completed" status.
- No more than 75 activities must be sent in one request

As part of completing this API request:

- If the target case is closed, it will be reopened.
- If the source case is left with no open activities, it will be closed.
- If any of the activities have responses which are in "Completed" status, the case of these activities will also be changed.
- If the target case is a new case:
 - The new case will be created in the same department as the original case.
 - The created case will be in open status.
 - The owner of the new case will be the same as the original case.
 - The customer of the new case will be the same as the original case. If the original case does not have a customer, the new case will not have a customer either.
 - The originatingChannel for the new case will be the same as original case.

Since:

11.6

APIs

Method	URL	Description
PUT	/ws/v12/interaction/activity/{IDs}/changeCase	Change case of one or more activities. {IDs}: a comma separated string of activity IDs that belong to the same case.

Authentication

Authentication is required. The client must be logged in to call this API. Each API request must contain X-egain-session request header returned by Login API.

Permissions

All of the following are required:

- User must have "Change Case" action on "Activity" resource.
- All the activities must belong to either the user's home department, or to a department in which the user is a foreign user.

Licenses

The logged in user must have the following licenses:

- ECE CIH Platform
- ECE Mail: To change the case of email activities.

Request

Request headers

Name	Description	Allowed values	Default value
X-egain-session	Session ID obtained from Login API response header	N/A	N/A
Accept	Content type accepted by client.	application/xml or application/json	N/A
Content-Type	Media type sent by the client	application/xml or application/json	N/A
Accept-Language	Language locale accepted by client (used for locale specific fields in resource representation and in error responses)	Supported 'Accept-Language' header codes	default system language

Request Body

The request body is mandatory and can be in either XML or JSON format. The request body varies depending on whether the target case for activities is a new case or an existing case.

Elements required in the request body for existing case

If the target case for activities is an existing case, the 'case' element in the request body must contain:

Name	Description
id	Must be an existing case ID in the application

Optional elements allowed in the request body for existing case

None

Elements required in the request body for new case

None, although the request body must be present with the case element.

Optional elements allowed in the request body for new case

Name	Description
case.dueDate	Must be a valid date, in the future.
case.severity.value	Must be 'urgent', 'high', 'medium' or 'low'.
case.subject	If not provided, the subject of the original case would be used as the subject of the case as well. Must not exceed 1024 characters.
case.description	Must not exceed 1024 characters.
case.solution	Must not exceed 1024 characters.
case.customAttributes	Names of the custom attributes must exist in ECE application. If the attribute is an enumeration, the values sent must be one from the list of allowed values.

Request body XML schemas:

- [Case Schema](#)

Supported API specific query parameters

None

Supported common query parameters

None

Response

Response headers

Name	Description	Possible values
X-regain-session	ID of the current user	N/A

	session	
Content-Type	Media type of response body	application/xml or application/json

If a new case is created, URI of the newly created case is returned in the Location response header:

Name	Description	Possible values
Location	URI of new resource, in the format /{context-root}/ws/v12/interaction/case/{ID}	N/A

Response body

The response body will be sent only in case of error. It can be in either XML or JSON format.

Response body XML schemas:

- [Error](#) - used in case of error

HTTP status codes

Success Status codes

201 - Created

- Successfully created a new case and changed the case of the activities the newly created case. The response will contain a "Location" header indicating the URI of the newly created case.

204 - No Content

- Successfully changed the case of the activities to the target case.

Failure Status codes

400 - Bad Request

- Any query parameter is sent in the request.
- Any criteria for successful execution mentioned in the [Overview](#) and [Request Body](#) sections are violated.

401 - Unauthorized

- X-egain-session request header is missing.
- Session is invalid or expired.

403 - Forbidden

- The user does not have sufficient permissions. Refer the [Permissions](#) section for details.
- One or more activities in the request URI are locked by another user.

404 - Not Found

- One or more activities in the request URI do not exist.

406 - Not Acceptable

- Invalid 'Accept-Language' header value.

500 - Internal server error

Examples:

[Example 1 - Change case of an activity to a new case without optional attributes](#)

[Example 2 - Change case of an activity to an existing case](#)

[Example 3 - Change case of multiple activities to an existing case](#)

[Example 4 - Change case of multiple activities to a new case by providing all case attributes](#)

PutChangeCustomerPage Class Reference

Detailed Description

Change Customer of Activities

Overview

This API can be used to change the customer of one or more activities of a case.

For this API to execute successfully:

- At least one activity must be present in the request body.
- The target customer of any of the activities must not be same as the current customer.
- All activities provided in the request body must exist in the application.
- All activities must be in status "in queue waiting to be assigned" or "assigned to a user".
- If a response exists in application for any of the activities provided in the request body, the response must be in "Completed" status.
- All activities must belong to the same case, and the case must exist in the application.
- None of the activities must be locked by another user.
- For each activity, a contact point must be provided. The following rules apply:
 - An email activity can be associated only with an email contact point.
 - All other types of activities can be associated with any contact point.
- All contact points provided in the request body must exist in the application and belong to the same customer.
- If "Customer departmentalization" setting is enabled in the application, the customer of the target contact point and the customer of the activity must belong to the same department.
- No more than 75 activities must be sent in the request body.

As part of completing this API request:

- Customer, contact person and contact point of the activities provided in the request body will be changed.
- If any of the activities have responses which are in "Completed" status, the customer, contact person and contact point for those response activities will also be changed.
- The value of the field "contactPointData" of the activity is not changed. This is retained with the original value. Only the customer association of the activity is changed.

Since:

11.6

APIs

Method	URL	Description
PUT	/ws/v12/interaction/activity/changecustomer	Change customer of activities provided in the request body.

Authentication

Authentication is required. The client must be logged in to call this API. Each API request must

contain X-egain-session request header returned by Login API.

Permissions

All of the following are required:

- User must have "Change Customer" action on "Customer" resource.
- All the activities must belong to either the user's home department, or to a department in which the user is a foreign user.

Licenses

The logged in user must have the following licenses:

- ECE CIH Platform
- ECE Mail: To change the customer of email activities.

Request

Request headers

Name	Description	Allowed values	Default value
X-egain-session	Session ID obtained from Login API response header	N/A	N/A
Accept	Content type accepted by client.	application/xml or application/json	N/A
Content-Type	Media type sent by the client	application/xml or application/json	N/A
Accept-Language	Language locale accepted by client (used for locale specific fields in resource representation and in error responses)	Supported 'Accept-Language' header codes	default system language

Request Body

The request body is mandatory and can be in either XML or JSON format.

Elements required in the request body

"activities" element must be present in the request body. At least one "activity" element must be present in the "activities" element. Each "activity" element must contain the following elements:

Name	Description
------	-------------

id	ID of the activity
customer.contactpersons.contactperson.contactpoints.contactpoint.id	ID of the contact point

Optional elements allowed in the request body

None

PutCompleteActivityPage Class Reference

Detailed Description

Complete Activities

Overview

This API can be used to complete multiple activities assigned to the logged in user. These activities may or may not have a case and the activities may belong to different cases. API cannot be used to complete draft replies created for email activities.

For this API to execute successfully:

- All activities must exist in the application.
- All the activities must be assigned to the logged in user, and must be in "Assigned" status.
- The activities must be of type Email. Chat activities cannot be completed by this API.
- If the value of the setting "Force activity categorization" for the department of the activity is "yes", the activity must be classified with a category (as configured in the application)
- If the value of the setting "Force resolution code" for the department of the activity is "yes", the activity must be classified with a resolution code (as configured in the application)
- No more than 75 activities must be sent in one request.
- None of the activities must be awaiting supervision, i.e., waiting for supervisor to accept or reject the activity.

As part of completing this API request:

- The activities sent in the request will be completed.
- Upon completing an activity, the case of the activity will also be closed if there are no other open activities in that case.

Since:

11.6

APIs

Method	URL	Description
PUT	/ws/v12/interaction/activity/complete	Complete one or more activities assigned to self.

Authentication

Authentication is required. The client must be logged in to call this API. Each API request must contain X-again-session request header returned by Login API.

Permissions

All of the following are required:

- Use must have "Complete" action on "Activity" resource.

- All the activities must either belong to the user's home department, or to a department in which the user is a foreign user.

Licenses

The logged in user must have the following licenses:

- ECE CIH Platform
- ECE Mail: To complete email activities.

Request

Request headers

Name	Description	Allowed values	Default value
X-egain-session	Session ID obtained from Login API response header	N/A	N/A
Accept	Content type accepted by client.	application/xml or application/json	N/A
Content-Type	Media type sent by the client	application/xml or application/json	N/A
Accept-Language	Language locale accepted by client (used for locale specific fields in resource representation and in error responses)	Supported 'Accept-Language' header codes	default system language

Request Body

The request body is mandatory and can be in either XML or JSON format.

Elements required in the request body

"activities" element must be present in the request body. At least one "activity" element must be present in the "activities" element. Each "activity" element must contain the following elements:

Name	Description
id	ID of the activity
lastModified.date	Value of last modified date of the activity

Optional elements allowed in the request body

None

Request body XML schemas:

- [Activity Schema](#)

Supported API specific query parameters

None

Supported common query parameters

None

Response

Response headers

Name	Description	Possible values
X-egain-session	ID of the current user session	N/A
Content-Type	Media type of response body	application/xml or application/json

Response Body

Response body will have all the activities that were sent for completion. The response body can be in either XML or JSON format.

Elements sent in the response body

'activities' element will be present in the response body. At least one 'activity' element will be present in the 'activities' element. Each 'activity' element will contain the following elements:

Name	Description
id	ID of the activity completed.
link	Self link of the activity completed.

If the activity has a case, then 'case' element will be present in the response body. Each 'case' element will contain the following elements:

Name	Description
id	ID of the case.
link	Link to the case.
status.value	The status of the case.

Response body XML schemas:

- [Activities Schema](#) - used in case of success
- [Error](#) - used in case of error

HTTP status codes

Success Status codes

200 - Success

- Successfully completed the activities sent in the request body.

Failure Status codes

400 - Bad Request

- Any query parameter is sent in the request.
- Any criteria for successful execution mentioned in the [Overview](#) and [Request Body](#) sections are violated.

401 - Unauthorized

- X-egain-session request header is missing.
- Session is invalid or expired.

403 - Forbidden

- The user does not have sufficient permissions. Refer the [Permissions](#) section for details.

406 - Not Acceptable

- Invalid 'Accept-Language' header value.

409 - Conflict

- The lastModified date of any activity in the request does not match its lastModified date on the server.

500 - Internal server error

Examples:

[Example 1 - Complete activities of multiple cases](#)

[Example 2 - Complete single activity resulting in case getting closed](#)

[Example 3 - Complete single activity without a case](#)

PutPickActivityPage Class Reference

Detailed Description

Pick Activities

Overview

This API can be used by the logged in user to pick specific activities from other users and queues.

This API cannot be used to pick draft responses created for incoming email activities.

For this API to execute successfully:

- All activities must exist in the application.
- The activities must be of type Email. Chat type of activities cannot be picked using this API.
- The activities must not be assigned to the user performing this operation.
- The status of all activities in the request must be either "in queue waiting to be assigned" or "assigned to a user".
- If an activity is assigned to a different user then:
 - The activity must not be locked by that user.
 - If the activity is pinned by the user, the query parameter "unpin" must be sent with a value of "yes".
- No more than 75 activities must be sent in one request.

As part of completing this API request:

- User load is not considered, i.e., activities will be assigned to the logged in user regardless of the user's existing work load.

Since:

11.6

APIs

Method	URL	Description
PUT	/ws/v12/interaction/activity/pick	Pick one or more activities from other users and queues.

Authentication

Authentication is required. The client must be logged in to call this API. Each API request must contain X-again-session request header returned by Login API.

Permissions

All of the following are required:

- User must have 'Pick Activities' action on 'Activity' resource.
- If status of any activity is "assigned to a user" then:

- The logged in user must have "Pull activities" permission on the user to whom the activity is currently assigned.
- If the activity is pinned by a user, and the query parameter "unpin" is sent with a value of "yes":
 - The logged in user must have 'Unpin' action on 'Activity' resource.
-
-
- If status of any activity is "in queue waiting to be assigned" then:
 - The logged in user must have "Pull activities" permission on the activities' queue.
-
- All the activities must either belong to the logged in user's home department, or to a department in which the user is a foreign user.

Licenses

The logged in user must have the following licenses:

- ECE CIH Platform
- ECE Mail: If any email activity is picked

Request

Request headers

Name	Description	Allowed values	Default value
X-egain-session	Session ID obtained from Login API response header	N/A	N/A

- The logged in user must have transfer permission on the target user.
- All the activities must either belong to the home department of the logged in user, or to a department in which the user is a foreign user.
- If activity is not assigned to the logged in user, the logged in user must have the permissions as required by Pick Activities API. Refer [Permissions](#) section for details.

Licenses

The logged in user must have the following licenses:

- ECE CIH Platform
- If activity is not assigned to the logged in user, the logged in user must have the licenses as required by Pick Activities API. Refer [Licenses](#) section for details.
- The target user must have the following licenses:
 - ECE Mail license for an email activity.
 - ECE CIH Platform license for a task or generic activity.

Request

Request headers

Name	Description	Allowed values	Default value
X-egain-session	Session ID obtained from Login API response header	N/A	N/A
Accept	Content type accepted by client.	application/xml or application/json	N/A
Content-Type	Media type sent by the client	application/xml or application/json	N/A
Accept-Language	Language locale accepted by client (used for locale specific fields in resource representation and in error responses)	Supported 'Accept-Language' header codes	default system language

Request Body

The request body is mandatory and can be in either XML or JSON format.

Elements required in the request body

'activities' element must be present in the request body. At least one 'activity' element must be present in the 'activities' element. Each 'activity' element must contain the following elements:

Name	Description
id	ID of the activity to be transferred
lastModified.date	Value of last modified date of the activity

Optional elements allowed in the request body

None

Request body XML schemas:

- [Activity Schema](#)

Supported API specific query parameters

Query parameters required in the request

- user: ID of the user to whom the activities should be transferred. This must be an existing user.

Query parameters allowed in the request

- unpin: The only value allowed for this query parameter is "yes". This is required to transfer activities even if they are pinned by a user. If any of the activities is pinned by a user and the "unpin" query parameter is not provided in the request, the request will fail.
- reassign: The only value allowed for this query parameter is "yes". This parameter indicates whether the activities being transferred can be reassigned to the logged in user by application. If the parameter is not provided, the system will not reassign the transferred activity to the logged in user.

Supported common query parameters

None

Response

Response headers

Name	Description	Possible values
X-egain-session	ID of the current user session	N/A
Content-Type	Media type of response body	application/xml or application/json

Response body

The response body will be sent only in case of error. It can be in either XML or JSON format.

Response body XML schemas:

- [Error](#) - used in case of error

HTTP status codes

Success Status codes

204 - No Content

- Successfully transferred the requested activities.

Failure Status codes

400 - Bad Request

- Unsupported query parameter is sent in the request.
- Unsupported query parameter value is sent in the request.
- Required API specific query parameters are not provided.
- Request body does not contain the required elements.
- Unsupported element is present in the request body.
- Any criteria for successful execution mentioned in the [Overview](#) or [Request Body](#) sections are violated (except when activity is locked, which will result in 403-Forbidden).

401 - Unauthorized

- X-egain-session request header is missing.
- Session is invalid or expired.

403 - Forbidden

- The user does not have sufficient permissions. Refer the [Permissions](#) section for details.
- One or more activities sent in the request are locked by another user.

406 - Not Acceptable

- Invalid 'Accept-Language' header value.

409 - Conflict

- The lastModified date of any activity in the request does not match its lastModified date on the server.

500 - Internal server error

Examples:

[Example 1 - Transfer an activity to user](#)

[Example 2 - Transfer multiple activities to a user](#)

Detailed Description

Queue Schema

Description of the elements used in [Queue](#) schema.

XML Schema File

model/v15/xsd/platform/queue.xsd

Name	Description	Type
id	ID of the queue	Long
name	Queue name	String
link	self link to the queue resource	Link
description	Queue description	String

Member Function Documentation

java.lang.String [getDescription](#) ()

Gets the value of the description property.

Returns:

possible object is [java.lang.String](#)

long [getId](#) ()

Gets the value of the id property.

Returns:

possible object is [Long](#)

[Link](#) [getLink](#) ()

Gets the value of the link property.

Returns:

possible object is [Link](#)

java.lang.String getName ()

Gets the value of the name property.

Returns:

possible object is [java.lang.String](#)

void setDescription (java.lang.String value)

Sets the value of the description property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setId (long value)

Sets the value of the id property.

Parameters:

<i>value</i>	allowed object is Long
--------------	--

void setLink ([Link](#) value)

Sets the value of the link property.

Parameters:

<i>value</i>	allowed object is Link
--------------	--

void setName (java.lang.String value)

Sets the value of the name property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

Queue Schema

Description of the elements used in [Queue](#) schema.

XML Schema File

model/v12/xsd/platform/queue.xsd

Name	Description	Type
id	ID of the queue	Long
name	Queue name	String
link	self link to the queue resource	Link

Member Function Documentation

long [getId](#) ()

Gets the value of the id property.

Returns:

possible object is [Long](#)

[Link](#) [getLink](#) ()

Gets the value of the link property.

Returns:

possible object is [Link](#)

java.lang.String [getName](#) ()

Gets the value of the name property.

Returns:

possible object is [java.lang.String](#)

void setId (long value)

Sets the value of the id property.

Parameters:

<i>value</i>	allowed object is Long
--------------	--

void setLink ([Link](#) value)

Sets the value of the link property.

Parameters:

<i>value</i>	allowed object is Link
--------------	--

void setName (java.lang.String value)

Sets the value of the name property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

Detailed Description

ReImport Schema

This schema contains [ReImport](#) type details.

XML Schema File

model/v12/xsd/kb/folder.xsd

Name	Description	Type
name	Signifies whether folder name should be re-imported. Allowed values : <ul style="list-style-type: none">• false• true	String
description	Signifies whether folder description should be re-imported. Allowed values : <ul style="list-style-type: none">• false• true	String
keywords	Signifies whether folder keywords should be re-imported. Allowed values : <ul style="list-style-type: none">• false• true	String

Member Function Documentation

java.lang.String getDescription ()

Gets the value of the description property.

Returns:

possible object is [java.lang.String](#)

java.lang.String getKeywords ()

Gets the value of the keywords property.

Returns:

possible object is [java.lang.String](#)

java.lang.String getName ()

Gets the value of the name property.

Returns:

possible object is [java.lang.String](#)

void setDescription (java.lang.String value)

Sets the value of the description property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setKeywords (java.lang.String value)

Sets the value of the keywords property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setName (java.lang.String value)

Sets the value of the name property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

RelatedQuestions Class Reference

Public Member Functions

- int [getCount](#) ()
 - java.util.List< java.lang.String > [getRelatedQuestion](#) ()
 - void [setCount](#) (int value)
-

Detailed Description

Related Question Schema

This schema contains [RelatedQuestions](#) type details.

XML Schema File

model/v12/xsd/kb/article.xsd

Name	Description	Type
relatedQuestion	Text of the related questions	String
count	Count of related questions	Int

Member Function Documentation

int [getCount](#) ()

Gets the value of the count property.

Returns:

possible object is [Integer](#)

java.util.List<java.lang.String> [getRelatedQuestion](#) ()

Gets the value of the relatedQuestion property.

This accessor method returns a reference to the live list, not a snapshot. Therefore any modification you make to the returned list will be present inside the JAXB object. This is why there is not a `set` method for the relatedQuestion property.

For example, to add a new item, do as follows:

```
getRelatedQuestion\(\).add(newItem);
```

Objects of the following type(s) are allowed in the list [java.lang.String](#)

void [setCount](#) (int *value*)

Sets the value of the count property.

Parameters:

<i>value</i>	allowed object is Integer
--------------	---

Request Class Reference

Public Member Functions

- java.util.List< [Parameter](#) > [getFormParam](#) ()
- java.lang.String [getMethod](#) ()
- java.lang.String [getRequestBodyText](#) ()
- java.lang.String [getUrl](#) ()
- void [setMethod](#) (java.lang.String value)
- void [setRequestBodyText](#) (java.lang.String value)
- void [setUrl](#) (java.lang.String value)

Detailed Description

Request Schema

A [Request](#) encapsulates one web service API request inside a [CompositeRequest](#) call.

XML Schema File

model/v3/xsd/meta/compositeRequest.xsd

Name	Description	Type	Included?
method	The HTTP method, such as GET or POST.	string	Always
url	The full URL of the request.	string	Always
formParam	Zero or more form parameters, if used.	Parameter	Optional
requestBodyText	Any required body of the request, if a POST or PUT.	string	Optional

Member Function Documentation

java.util.List<[Parameter](#)> [getFormParam](#) ()

Gets the value of the formParam property.

This accessor method returns a reference to the live list, not a snapshot. Therefore any modification you make to the returned list will be present inside the JAXB object. This is why there is not a set method for the formParam property.

For example, to add a new item, do as follows:

```
getFormParam().add(newItem);
```

Objects of the following type(s) are allowed in the list [Parameter](#)

java.lang.String getMethod ()

Gets the value of the method property.

Returns:

possible object is [java.lang.String](#)

java.lang.String getRequestBodyText ()

Gets the value of the requestBodyText property.

Returns:

possible object is [java.lang.String](#)

java.lang.String getUrl ()

Gets the value of the url property.

Returns:

possible object is [java.lang.String](#)

void setMethod (java.lang.String value)

Sets the value of the method property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setRequestBodyText (java.lang.String value)

Sets the value of the requestBodyText property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setUrl (java.lang.String value)

Sets the value of the url property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

RequestHeadersActivityPostSection Class Reference

Detailed Description

Request headers

Name	Description	Allowed values	Default value
X-egain-session	Session ID obtained from Login API response header	N/A	N/A
Content-Type	Media type sent by the client.	application/xml or application/json or multipart/form-data	N/A
Accept	Content type accepted by the client.	application/xml or application/json	N/A
Accept-Language	Language locale accepted by client (used for locale specific fields in resource representation and in error responses)	Supported 'Accept-Language' header codes	default system language

</complexContent></complexType>
```

Member Function Documentation

[Article](#) `getArticle ()`

Gets the value of the article property.

Returns:

possible object is [Article](#)

[Attachment](#) `getAttachment ()`

Gets the value of the attachment property.

Returns:

possible object is [Attachment](#)

`Topic` `getTopic ()`

Gets the value of the topic property.

Returns:

possible object is [Topic](#)

`void` `setArticle` ([Article](#) *value*)

Sets the value of the article property.

Parameters:

<i>value</i>	allowed object is Article
--------------	---

void setAttachment ([Attachment](#) value)

Sets the value of the attachment property.

Parameters:

<i>value</i>	allowed object is Attachment
--------------	--

void setTopic ([Topic](#) value)

Sets the value of the topic property.

Parameters:

<i>value</i>	allowed object is Topic
--------------	---

Resource2 Class Reference

Public Member Functions

- `java.util.List<Serializable>` [getResourceGroup\(\)](#)
-

Detailed Description

Java class for [Resource2](#) complex type.

The following schema fragment specifies the expected content contained within this class.

```
<complexType name="Resource2"> <complexContent> <restriction
base="{http://www.w3.org/2001/XMLSchema}anyType"> <group
ref="{http://bindings.egain.com/ws/model/v12/gen/platform}ResourceGroup" maxOccurs="unbounded"/>
</restriction> </complexContent></complexType>
```

Member Function Documentation

`java.util.List<Serializable>` [getResourceGroup\(\)](#)

Gets the value of the resourceGroup property.

This accessor method returns a reference to the live list, not a snapshot. Therefore any modification you make to the returned list will be present inside the JAXB object. This is why there is not a `set` method for the resourceGroup property.

For example, to add a new item, do as follows:

```
getResourceGroup\(\).add(newItem);
```

Objects of the following type(s) are allowed in the list [Article](#) [Topic](#) [Attachment](#)

ResponseHeadersSection Class Reference

 - void [setMessage](#) (java.lang.String value)
-

Detailed Description

Result Schema

A [Result](#) includes the HTTP status and an optional message for each API call made. The message is non-null only if an error occurred.

XML Schema File

model/v3/xsd/meta/result.xsd

Name	Description	Type	Included?
httpStatus	The status (200, 201, etc.) of the call.	string	Always
message	An optional error message.	string	Optional

Member Function Documentation

Element [getAny](#) ()

Gets the value of the any property.

Returns:

possible object is [Element](#)

java.lang.String [getHttpStatus](#) ()

Gets the value of the httpStatus property.

Returns:

possible object is [java.lang.String](#)

java.lang.String [getMessage](#) ()

Gets the value of the message property.

Returns:

possible object is [java.lang.String](#)

void setAny (Element *value*)

Sets the value of the any property.

Parameters:

<i>value</i>	allowed object is Element
--------------	---

void setHttpStatus (java.lang.String *value*)

Sets the value of the httpStatus property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setMessage (java.lang.String *value*)

Sets the value of the message property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

ResultV12 Class Reference

 - void [setMessage](#) (java.lang.String value)
-

Detailed Description

ResultObject Schema

A ResultObject contains a response for one call made through /v12/composite API.

XML Schema File

model/v3/xsd/meta/resultV12.xsd

Name	Description	Type	Included?
'any' in json, and an actual element name in xml	A server response for one call submitted through Composite API.	xs:any	Always
httpStatus	The status (200, 201, etc.) of the call.	string	Always
message	An optional error message.	string	Optional

Member Function Documentation

Object [getAny](#) ()

Gets the value of the any property.

Returns:

possible object is [Element Object](#)

java.lang.String [getHttpStatus](#) ()

Gets the value of the httpStatus property.

Returns:

possible object is [java.lang.String](#)

java.lang.String [getMessage](#) ()

Gets the value of the message property.

Returns:

possible object is [java.lang.String](#)

void setAny (Object *value*)

Sets the value of the any property.

Parameters:

<i>value</i>	allowed object is Element Object
--------------	--

void setHttpStatus (java.lang.String *value*)

Sets the value of the httpStatus property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setMessage (java.lang.String *value*)

Sets the value of the message property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

Sets the value of the name property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

SearchActivitiesExamples Class Reference

Detailed Description

Examples for Search Customer Activities

Example 1 - Search for activities with pagination parameters

This example demonstrates the following:

- Getting summary attributes of activities belonging to logged in customer.
- Using pagination parameters in the request (\$pagenum and \$pagesize). The paginationInfo element in the response shows the links to the previous and next pages.
- Default sorting (sorting on activity ID in ascending order).

XML

Request

Method	URL
GET	/ws/v15/context/interaction/activity?\$pagesize=2&\$pagenum=2

Request headers

Name	Values
X-egain-session	valid session ID
Accept	application/xml
Accept-Language	en-US

Response:

HTTP/1.1 200 OK

Response headers

Name	Values
X-egain-session	current session ID
Content-Type	application/xml

Response body

```
<?xml version="1.0" encoding="UTF-8" standalone="yes" ?><activities

```

Example 2 - Search for activities by case

This example demonstrates the following:

- Get all attributes of the activities of the logged in customer based on case ID.
- Default sorting (sorting on activity ID in ascending order).

Example 3 - Search for activities by status with range parameters

This example demonstrates the following:

- Searching activities of logged in customer based on status. In this example, the activities in open status are retrieved.
- Using range parameters (\$rangestart and \$rangesize) in the request. Note that no paginationInfo node is returned for range parameters.
- Requesting additional attributes, including a custom attribute, through \$attribute system parameter. In this example, the additional attributes requested are "created" and "custom.complainttype".

Example 4 - Search for activities by mode sorted by activity ID

This example demonstrates the following:

- Searching activities of the logged in customer based on mode. In this example, all outbound activities are retrieved.
- Using default sort column, but in descending order. (default sorting is on activity ID)
- Retrieving all the activity attributes, through \$attribute system parameter.

Example 5 - Search for unread activities sorted by case ID

This example demonstrates the following:

- Searching activities for logged in customer that are unread.
- Specifying the sorting explicitly. In this example, sorting is on case in descending order.

Example 6 - Get count of inbound read activities in completed status

This example demonstrates the following:

- Getting count of activities by using \$count system parameter. This example retrieves the count of activities for logged in customer that are read and in completed status.
- The response when \$count is specified. Note that the link to the first page has all the parameters as specified in the original request except the \$count parameter.

```

Example 7 - Search for secure email activities

This example demonstrates the following:

- Searching activities for logged in customer that are of type email and secure.
- Retrieving all the activity attributes, through \$attribute system parameter.

Example 8 - Search for secure email activities of another customer

This example demonstrates the following:

- Searching secure email activities of another customer, belonging to a specific case.
- Retrieving just the summary attributes.
- URLs in the links of an activity representation when activity belongs to another customer.

XML

Request

Method	URL
GET	/ws/v15/context/interaction/activity?customer=1000&secure=yes&type=email&case=1095

Request headers

SearchCasesExamples Class Reference

Detailed Description

Examples for search for cases

Example 1 - Search for cases by status with range parameters

This example demonstrates the following:

- Get summary attributes for cases based on status. In this example, all open cases are retrieved.
- Sorting on case ID in descending order.
- Using range parameters (\$rangestart and \$rangesize) in the request. Note that paginationInfo node is not returned for range parameters.

XML

Request

Method	URL
GET	/ws/v15/context/interaction/case?status=open&\$rangestart=5&\$rangesize=2&\$sort=id&\$order=desc

Request headers

Name	Values
X-egain-session	valid session ID
Accept	application/xml
Accept-Language	en-US

Response:

HTTP/1.1 200 OK

Response headers

Name	Values
X-egain-session	current session ID
Content-Type	application/xml

Response body

```

Example 2 - Search for cases by customer with pagination parameters

This example demonstrates the following:

- Getting all attributes of the cases of the logged in customer.
- Sorting on custom attribute. In this example, the results are sorted on "work_status".
- Using pagination parameters in the request (\$pagenum and \$pagesize). The paginationInfo element in the response shows the links to the previous and next pages.

XML

Request

Method	URL
GET	/ws/v15/context/interaction/case?\$pagesize=3&\$pagenum=2&\$attribute=all&\$sort=custom.work_status

Request headers

Name	Values

```

Example 3 - Get count of cases in a status

This example demonstrates the following:

- Getting count of activities by using \$count system parameter. This example retrieves the count of cases for logged in customer that are in "closed" status.
- The response when \$count is specified. Note that the link to the first page has all the parameters as specified in the original request except the \$count parameter.

XML

Request

Method	URL
GET	/ws/v15/context/interaction/case?status=closed&\$count=yes&\$attribute=all

Request headers

Name	Values
X-egain-session	valid session ID
Accept	application/xml
Accept-Language	en-US

Response:

HTTP/1.1 200 OK

Response headers

Name	Values
X-egain-session	current session ID
Content-Type	application/xml

Response body

```

    "pagenum": 1,
    "pagesize": 25
  }
}
```

Example 5 - Search for open cases containing at least one inbound activity sorted by most recently created activity

This example demonstrates the following:

- Get creation date of most recent activity and count of unread inbound activities, along with summary attributes of the case.
- Filter cases based on 'activityMode' and 'status' of case. In this example, all open cases with at least one inbound activity are retrieved.
- Sorting on creation date of most recent activity of the case in descending order.
- Using pagination parameters in the request (\$pagenum and \$pagesize). The paginationInfo element in the response shows the links to the previous and next pages.

XML

Request

Method	URL
GET	/ws/v15/context/interaction/case?activityMode=inbound&status=open&\$pagesize=3&\$pagenum=2&\$sort=recentActivity&\$attribute=recentActivityDate,unreadActivityCount

Request headers

}
```

SearchCustomerActivitiesPage Class Reference

Detailed Description

Search activities

Overview

This API allows to search for customer activities based on various criteria. Refer the page [Activities visible to a customer](#) for information about the activities visible to the customer.

If no activities match the search criteria, the server will respond with 204 success code and an empty body. This API only supports exact match searches; partial matches are not supported. For example, if customer activities are searched for case ID 1080, then only activities with case ID 1080 will be returned. Activities associated with case ID 10801 will not be returned.

Since:

11.6

APIs

Method	URL	Description
GET	/ws/v15/context/interaction/activity	Retrieve all activities belonging to logged in customer.
GET	/ws/v15/context/interaction/activity?case={ID}	Retrieve activities for one case ID. {ID} is the ID of the case.
GET	/ws/v15/context/interaction/activity?status={VAL}	Retrieve activities having status with value {VAL}.
GET	/ws/v15/context/interaction/activity?mode={VAL}	Retrieve activities having mode with value: {VAL}.
GET	/ws/v15/context/interaction/activity?read={VAL}	Retrieve activities which are read or unread based on the value: {VAL}.
GET	/ws/v15/context/interaction/activity?type={VAL}	Retrieve activities of type value: {VAL}.
GET	/ws/v15/context/interaction/activity?secure={VAL}	Retrieve activities which are secure or not based on the value: {VAL}.
GET	/ws/v15/context/interaction/activity?customer={ID}	Retrieve activities of another customer. {ID} is the ID of the other customer..

NOTE: You can mix and match one or more filter criteria listed above in any order. If more than one filter criteria are used, then response will only contain activities that satisfy all filter criteria.

Authentication

Authentication is required. The customer must be logged in to call this API. Each API request must contain X-egain-session request header returned by Login API.

Permissions

- All authenticated customers can access this API.
- Only activities that the customer (self, or customer sent in as query parameter) can view will be returned (refer the [Overview](#) section for details).
- If the query parameter customer={ID} is provided, the logged in customer must be authorized to perform this action on behalf of the customer specified through the 'customer' parameter. Otherwise, the application will return a 400 (bad request) response code. Refer [Customer grants](#) for more information about authorization.

Request

Request headers

Name	Description	Allowed values	Default value
X-egain-session	Session ID obtained from Login API response header	N/A	N/A
Accept	Content type accepted by client	application/xml or application/json	N/A
Accept-Language	Language locale accepted by client (used for locale specific fields in resource representation and in error responses)	Supported 'Accept-Language' header codes	default system language

Supported API specific query parameters

By default, the activities will be filtered by the logged in customer. If the "customer" query parameter is provided, the filtering will be on the ID of the customer provided through the "customer" query parameter. , one or more query parameters from the list below can be supplied per API call:

- **case:** case ID to be used in activity search. This returns the activities of the case.
- **status:** status value of an activity. Status value can be "open" or "completed". If the value "open" is specified, the filter will return all activities that are not in "completed" status.

- **mode:** mode value of an activity. Valid values for mode are: "inbound", "outbound", and "none". This returns the activities in specified mode.
- **read:** read value can be either "yes" or "no". This returns the activities which are read or unread based on the value provided in the parameter.
- **type:** type value of an activity. Allowed values for type are: "email" and "chat". This returns the activities of specified type.
- **secure:** secure value can be either "yes" or "no". This returns the activities which are secure or not based on the value provided in the parameter.
- **customer:** ID of the customer whose activities have to be fetched. For this to be successful, the logged in customer must be authorized to perform this action on behalf of the customer specified through the 'customer' parameter. Refer [Customer grants](#) for more information about authorization.

Supported common query parameters

Following common query parameters are supported for this API. Refer the [Supported Common Query Parameters in ECE REST API](#) page for detailed description of each common parameter listed below.

- \$attribute - [Values of \\$attribute common parameter supported by Activity Resource](#)
- \$sort - [Values of \\$sort common parameter supported by Activity Resource](#)
- \$order
- \$pagenum
- \$pagesize
- \$rangestart
- \$rangesize
- \$count

Response

Response headers

Name	Description	Possible values
X-egain-session	Session ID of the current user session	N/A
Content-Type	Media type of response body	application/xml or application/json

Response body xml schemas:

- [Activities Schema](#) - used in case of success
- [Error](#) - used in case of error

Summary attributes always returned in server response

[Summary attributes of Activity Resource](#)

Additional attributes returned in server response if explicitly requested by client

Server can be prompted to return additional attributes of resource representation using \$attribute common query parameter. [Values of \\$attribute common parameter supported by Activity Resource](#) for the list of allowed attribute names.

HTTP status codes

Success Status codes

200 - OK

- If \$count parameter is provided in the request, the count of the activities will be provided in the response. If no activities qualify for the criteria, the count will be returned as 0.
- If \$count parameter is not provided in the request, the qualifying activities will be returned in the response.

204 - No Content

- This will be returned only if \$count parameter is not provided in the request, and one of the below are true:
 - No matches were found for given search criteria.
 - Matches found for this search, however the requested page or range doesn't contain any results.

Failure Status codes

400 - Bad Request

- Unsupported query parameter sent in the request.
- Unsupported query parameter value sent in the request.
- Unsupported combination of common query parameters (\$order provided without \$sort, mixing of pagination and range parameters etc.)
- The logged in customer does not have grants on the customer provided through the query parameter "customer".

401 - Unauthorized

- X-egain-session request header is missing
- Session is invalid or expired

406 - Not Acceptable

- Invalid 'Accept-Language' header value

500 - Internal server error

Examples:

[Example 1 - Search for activities with pagination parameters](#)

[Example 2 - Search for activities by case](#)

[Example 3 - Search for activities by status with range parameters](#)

[Example 4 - Search for activities by mode sorted by activity ID](#)

[Example 5 - Search for unread activities sorted by case ID](#)

[Example 6 - Get count of inbound read activities in completed status](#)

[Example 7 - Search for secure email activities](#)

[Example 8 - Search for secure email activities of another customer](#)

SearchCustomerCasesPage Class Reference

Detailed Description

Search for cases

Overview

This API allows to search for customer cases based on various criteria. If no cases match the search criteria, the server will respond with 204 success code and an empty body.

Only those cases having at least one activity visible to the customer (self, or customer sent in as query parameter) will be returned. Refer the page [Activities visible to a customer](#) for information about the activities visible to the customer.

Since:

11.6

APIs

Method	URL	Description
GET	/ws/v15/context/interaction/case	Retrieve all cases belonging to logged in customer.
GET	/ws/v15/context/interaction/case?status={VAL}	Retrieve cases having status with value: {VAL}.
GET	/ws/v15/context/interaction/case?customer={ID}	Retrieve cases of another customer with ID: {ID}.
GET	/ws/v15/context/interaction/case?activityMode={VAL}	Retrieve cases having at least one activity with mode value: {VAL}.

Authentication

Authentication is required. The customer must be logged in to call this API. Each API request must contain X-again-session request header returned by Login API.

Permissions

- All authenticated customers can access this API.
- If the query parameter customer={ID} is provided, the logged in customer must be authorized to perform this action on behalf of the customer specified through the "customer" query parameter. Otherwise, the application will return a 400 (bad request) response code. Refer [Customer grants](#) for more information about authorization.

Request

Request headers

Name	Description	Allowed values	Default value
X-egain-session	Session ID obtained from Login API response header	N/A	N/A
Accept	Content type accepted by client	application/xml or application/json	N/A
Accept-Language	Language locale accepted by client (used for locale specific fields in resource representation and in error responses)	Supported 'Accept-Language' header codes	default system language

Supported API specific query parameters

By default, the cases will be filtered by the logged in customer. If the "customer" query parameter is provided, the filtering will be on the ID of the customer provided through the "customer" query parameter. , one or more query parameters from the list below can be supplied per API call:

- **status:** status value of a case. Status value can be "open" or "closed".
- **customer:** ID of the customer of the case. For this API to be successful, the logged in customer must be authorized to perform this action on behalf of the customer specified through "customer" query parameter. Refer [Customer grants](#) for more information about authorization.
- **activityMode:** Only those cases that contain one or more activities in the activityMode value sent, will be returned. Value can be "inbound" or "outbound".

Supported common query parameters

Following common query parameters are supported for this API. Refer the [Supported Common Query Parameters in ECE REST API](#) page for detailed description of each common parameter listed below.

- \$attribute - [Values of \\$attribute common parameter supported by Case Resource](#)
- \$sort - [Values of \\$sort common parameter supported by Case Resource](#)
- \$order
- \$pagenum
- \$pagesize
- \$rangestart
- \$rangesize
- \$count

Response

Response headers

Name	Description	Possible values
X-egain-session	Session ID of the current user session	N/A
Content-Type	Media type of response body	application/xml or application/json

Response body xml schemas:

- [Cases Schema](#) - used in case of success
- [Error](#) - used in case of error

Summary attributes always returned in server response

[Summary attributes of Case Resource](#)

Additional attributes returned in server response if explicitly requested by client

Server can be prompted to return additional attributes of resource representation using `$attribute` common query parameter. [Values of \\$attribute common parameter supported by Case Resource](#) for the list of allowed attribute names.

HTTP status codes

Success Status codes

200 - OK

- If `$count` parameter is provided in the request, the count of the cases will be provided in the response. If no cases qualify for the criteria, the count will be returned as 0.
- If `$count` parameter is not provided in the request, the qualifying cases will be returned in the response.

204 - No Content

- This will be returned only if `$count` parameter is not provided in the request, and one of the below are true
 - No matches were found for given search criteria.
 - Matches were found for this search, however the requested page or range doesn't contain any results.

Failure Status codes

400 - Bad Request

- Unsupported query parameter sent in the request.
- Unsupported query parameter value sent in the request.
- Unsupported combination of common query parameters (`$order` provided without `$sort`, mixing of pagination and range parameters etc.) are provided in the request.
- The logged in customer does not have grants on the customer provided through the query parameter "customer".

401 - Unauthorized

- X-egain-session request header is missing
- Session is invalid or expired

406 - Not Acceptable

- Invalid 'Accept-Language' header value

500 - Internal server error

Examples:

[Example 1 - Search for cases by status with range parameters](#)

[Example 2 - Search for cases by customer with pagination parameters](#)

[Example 3 - Get count of cases in a status](#)

[Example 4 - Search for cases of another customer by case status](#)

[Example 5 - Search for open cases containing at least one inbound activity sorted by most recently created activity](#)

SearchRangeParameterInformation Class Reference

Detailed Description

Range Query Parameter Representation

Range query parameters allow to specify a start and end value between which the parameter value lies.

For date query parameter values, following range format is supported:

[start,end]

- "start" and "end" represent range start date and range end date respectively. For supported date representation and timezone refer [this page](#).
- The range values have to be specified within square brackets.
- The values specified in the range are inclusive. For example [2015-12-23T08:39:16.000Z,2015-12-28T08:39:16.000Z] will fetch all records starting from 2015-12-23T08:39:16.000Z to 2015-12-28T08:39:16.000Z date.
- At least one of "start" or "end" must be provided.
- If only "start" is provided, the application gets all matching records "on-or-after" start date. For example [2015-12-23T08:39:16.000Z,] will fetch all records on or after 2015-12-23T08:39:16.000Z date. Note that comma is required after start date.
- If only "end" is provided, the application gets all matching records "on-or-before" end date. For example [,2015-12-28T08:39:16.000Z] will fetch all records on or before 2015-12-28T08:39:16.000Z date. Note that comma is required before end date.

void setLastModified (XMLGregorianCalendar value)

Sets the value of the lastModified property.

Parameters:

<i>value</i>	allowed object is XMLGregorianCalendar
--------------	--

void setName (java.lang.String value)

Sets the value of the name property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

SessionIntegrationPage Class Reference

Detailed Description

Starting with ECE 11.6, when a user logs into ECE application consoles and is successfully authenticated, the user is automatically logged in to make calls to the interaction and authoring REST APIs. If the user logs out from ECE console, she will be automatically logged out for that session from ECE REST API.

Upon successful authentication to ECE console, a session cookie containing the user's session identifier is created and set on the user's web browser. The name of this session cookie is `X-egain-session`. In addition, a token to prevent Cross-Site Request Forgery (CSRF) attacks is also created by the server. The name of this token is `X-egain-csrf`. The same session identifier and the anti-CSRF token can be used for making calls to ECE REST APIs.

In order to make REST API calls seamlessly from ECE application console, you need to pass the session identifier (`X-egain-session`) as well as anti-CSRF token (`X-egain-csrf`) with every API request.

- `X-egain-session` needs to be sent in as a cookie. The cookie is sent automatically by the browser if the call is made from the same browser session.
- `X-egain-csrf` needs to be sent in as a header. You need to explicitly send the `X-egain-csrf` header with the request. For your convenience, a utility JavaScript function `getEgainSecurityToken` has been provided to retrieve the value of this token. See [my_activities.html](#) file for details on how to use this function.

Example:

1. Copy [my_activities.html](#) file on your ECE application installation's web server in `ECE_INSTALLATION_FOLDER/web/custom/view` folder.
2. Login as a partition administrator, and add a new custom Information pane from the Tools Console. Set the launch URL to: http://WEB_SERVER_ADDRESS/CONTEXT_ROOT/web/custom/view/my_activities.html.
3. Login to the Agent Console.
4. Go to the My Activities section of the Information pane. When this section loads, it will make an AJAX request to ECE REST API with `X-egain-csrf` request header, and browser automatically will send the `X-egain-session` cookie. This AJAX request makes a GET Activity API call to fetch all activities for the logged in user. Response is rendered in the Information pane.

In this example the following AJAX code snippet calls an ECE REST API using jQuery. Note that the `X-egain-csrf` request header sent in the request contains anti-CSRF token.

```
$(document).ready(function(){
$.ajax({
url:"../../../../ws/v12/interaction/activity?assignedTo=" + userId,
type:'GET',
headers: {'X-egain-csrf':eGainCSRFToken, 'Accept-Language':'en-US',
'Accept':'application/json'},
complete:function(xhr, status){
if
(status=='success' && xhr.status=='200')
{
// Code to render the response
}
}}});
```

void setAdapter ([Adapter](#) value)

Sets the value of the adapter property.

Parameters:

<i>value</i>	allowed object is Adapter
--------------	---

void setMessage ([SocialMessage](#) value)

Sets the value of the message property.

Parameters:

<i>value</i>	allowed object is SocialMessage
--------------	---

void setParentActivity ([IDAndLink](#) value)

Sets the value of the parentActivity property.

Parameters:

<i>value</i>	allowed object is IDAndLink
--------------	---

void setSearch ([Search](#) value)

Sets the value of the search property.

Parameters:

<i>value</i>	allowed object is Search
--------------	--

void setSearchResultId (Long value)

Sets the value of the searchResultId property.

Parameters:

<i>value</i>	allowed object is Long
--------------	--

Detailed Description

Social Message Schema

This schema contains [SocialMessage](#) details of a social activity.

XML Schema File

model/v15/xsd/interaction/activity.xsd

Name	Description	Type
id	id assigned by network to this post	String
source	The type of post	String
date	Datetime when message is posted	DateTime
url	URL to the post	String
user	Details of social user	SocialUser
sentiment	Search polarity	String
following	User is following this activity or not	Boolean
contents	Actual message content of message	Contents
networkAttributes	Network specific attributes for message	NetworkAttributes

Member Function Documentation

[Contents](#) `getContents ()`

Gets the value of the contents property.

Returns:

possible object is [Contents](#)

`XMLGregorianCalendar` `getDate ()`

Gets the value of the date property.

Returns:

possible object is [java.lang.String](#)

`java.lang.String` `getId ()`

Gets the value of the id property.

Returns:

possible object is [java.lang.String](#)

[NetworkAttributes](#) `getNetworkAttributes ()`

Gets the value of the networkAttributes property.

Returns:

possible object is [NetworkAttributes](#)

`java.lang.String` `getSentiment ()`

Gets the value of the sentiment property.

Returns:

possible object is [java.lang.String](#)

`java.lang.String` `getType ()`

Gets the value of the type property.

Returns:

possible object is [java.lang.String](#)

`java.lang.String` `getUrl ()`

Gets the value of the url property.

Returns:

possible object is [java.lang.String](#)

[SocialUser](#) `getUser ()`

Gets the value of the user property.

Returns:

possible object is [SocialUser](#)

Boolean isFollowing ()

Gets the value of the following property.

Returns:

possible object is [Boolean](#)

void setContents ([Contents](#) value)

Sets the value of the contents property.

Parameters:

<i>value</i>	allowed object is Contents
--------------	--

void setDate (XMLGregorianCalendar value)

Sets the value of the date property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setFollowing (Boolean value)

Sets the value of the following property.

Parameters:

<i>value</i>	allowed object is Boolean
--------------	---

void setId (java.lang.String value)

Sets the value of the id property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setNetworkAttributes ([NetworkAttributes](#) value)

Sets the value of the networkAttributes property.

Parameters:

<i>value</i>	allowed object is NetworkAttributes
--------------	---

void setSentiment (java.lang.String value)

Sets the value of the sentiment property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setType (java.lang.String value)

Sets the value of the type property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setUrl (java.lang.String value)

Sets the value of the url property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setUser ([SocialUser](#) *value*)

Sets the value of the user property.

Parameters:

<i>value</i>	allowed object is SocialUser
--------------	--

Member Function Documentation

[Contents](#) `getContents ()`

Gets the value of the contents property.

Returns:

possible object is [Contents](#)

`XMLGregorianCalendar` `getDate ()`

Gets the value of the date property.

Returns:

possible object is [java.lang.String](#)

`java.lang.String` `getId ()`

Gets the value of the id property.

Returns:

possible object is [java.lang.String](#)

[NetworkAttributes](#) `getNetworkAttributes ()`

Gets the value of the networkAttributes property.

Returns:

possible object is [NetworkAttributes](#)

`java.lang.String` `getSentiment ()`

Gets the value of the sentiment property.

Returns:

possible object is [java.lang.String](#)

`java.lang.String` `getType ()`

Gets the value of the type property.

Returns:

possible object is [java.lang.String](#)

`java.lang.String` `getUrl ()`

Gets the value of the url property.

Returns:

possible object is [java.lang.String](#)

[SocialUser](#) `getUser ()`

Gets the value of the user property.

Returns:

possible object is [SocialUser](#)

Boolean isFollowing ()

Gets the value of the following property.

Returns:

possible object is [Boolean](#)

void setContents ([Contents](#) value)

Sets the value of the contents property.

Parameters:

<i>value</i>	allowed object is Contents
--------------	--

void setDate (XMLGregorianCalendar value)

Sets the value of the date property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setFollowing (Boolean value)

Sets the value of the following property.

Parameters:

<i>value</i>	allowed object is Boolean
--------------	---

void setId (java.lang.String value)

Sets the value of the id property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setNetworkAttributes ([NetworkAttributes](#) value)

Sets the value of the networkAttributes property.

Parameters:

<i>value</i>	allowed object is NetworkAttributes
--------------	---

void setSentiment (java.lang.String value)

Sets the value of the sentiment property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setType (java.lang.String value)

Sets the value of the type property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setUrl (java.lang.String value)

Sets the value of the url property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setUser ([SocialUser](#) *value*)

Sets the value of the user property.

Parameters:

<i>value</i>	allowed object is SocialUser
--------------	--

Member Function Documentation

java.lang.String getAgentFirstName ()

Gets the value of the agentFirstName property.

Returns:

possible object is [java.lang.String](#)

Integer getAgentId ()

Gets the value of the agentId property.

Returns:

possible object is [Integer](#)

java.lang.String getAgentLastName ()

Gets the value of the agentLastName property.

Returns:

possible object is [java.lang.String](#)

java.lang.String getAgentLoginId ()

Gets the value of the agentLoginId property.

Returns:

possible object is [java.lang.String](#)

java.lang.String getAgentLoginName ()

Gets the value of the agentLoginName property.

Returns:

possible object is [java.lang.String](#)

java.lang.String getAgentTeamId ()

Gets the value of the agentTeamId property.

Returns:

possible object is [java.lang.String](#)

java.lang.String getAgentTeamName ()

Gets the value of the agentTeamName property.

Returns:

possible object is [java.lang.String](#)

java.lang.String getAni ()

Gets the value of the ani property.

Returns:

possible object is [java.lang.String](#)

Long getCallKey1 ()

Gets the value of the callKey1 property.

Returns:

possible object is [Long](#)

Long getCallKey2 ()

Gets the value of the callKey2 property.

Returns:

possible object is [Long](#)

java.lang.String getCallKey3 ()

Gets the value of the callKey3 property.

Returns:

possible object is [java.lang.String](#)

java.lang.String getCallKey4 ()

Gets the value of the callKey4 property.

Returns:

possible object is [java.lang.String](#)

java.lang.String getCallKey5 ()

Gets the value of the callKey5 property.

Returns:

possible object is [java.lang.String](#)

java.lang.String getCallReason ()

Gets the value of the callReason property.

Returns:

possible object is [java.lang.String](#)

java.lang.String getCallTypeName ()

Gets the value of the callTypeName property.

Returns:

possible object is [java.lang.String](#)

java.lang.String getChannel ()

Gets the value of the channel property.

Returns:

possible object is [java.lang.String](#)

java.lang.String getChannelOrigin ()

Gets the value of the channelOrigin property.

Returns:

possible object is [java.lang.String](#)

java.util.List<[Classification](#)> getClassification ()

Gets the value of the classification property.

This accessor method returns a reference to the live list, not a snapshot. Therefore any modification you make to the returned list will be present inside the JAXB object. This is why there is not a `set` method for the classification property.

For example, to add a new item, do as follows:

```
getClassification().add(newItem);
```

Objects of the following type(s) are allowed in the list [Classification](#)

java.lang.String getComplianceCustomAttributeColors ()

Gets the value of the complianceCustomAttributeColors property.

Returns:

possible object is [java.lang.String](#)

java.lang.String getComplianceEvent ()

Gets the value of the complianceEvent property.

Returns:

possible object is [java.lang.String](#)

Object getComplianceTag ()

Gets the value of the complianceTag property.

Returns:

possible object is [Object](#)

java.lang.String getCustomer ()

Gets the value of the customer property.

Returns:

possible object is [java.lang.String](#)

java.lang.String getCustomerId ()

Gets the value of the customerId property.

Returns:

possible object is [java.lang.String](#)

java.lang.String getEmailAddress ()

Gets the value of the emailAddress property.

Returns:

possible object is [java.lang.String](#)

java.lang.String getEmailSubject ()

Gets the value of the emailSubject property.

Returns:

possible object is [java.lang.String](#)

XMLGregorianCalendar getEndTime ()

Gets the value of the endTime property.

Returns:

possible object is [java.lang.String](#)

java.lang.String getFcrFlag ()

Gets the value of the fcrFlag property.

Returns:

possible object is [java.lang.String](#)

Integer getHandleTime ()

Gets the value of the handleTime property.

Returns:

possible object is [Integer](#)

java.lang.String getHoldFlag ()

Gets the value of the holdFlag property.

Returns:

possible object is [java.lang.String](#)

Integer getHoldTime ()

Gets the value of the holdTime property.

Returns:

possible object is [Integer](#)

java.lang.String getKnowledgeSessionId ()

Gets the value of the knowledgeSessionId property.

Returns:

possible object is [java.lang.String](#)

java.lang.String getKnowledgeUsed ()

Gets the value of the knowledgeUsed property.

Returns:

possible object is [java.lang.String](#)

java.lang.String getLanguage ()

Gets the value of the language property.

Returns:

possible object is [java.lang.String](#)

java.lang.String getOutboundBaAccountNumber ()

Gets the value of the outboundBaAccountNumber property.

Returns:

possible object is [java.lang.String](#)

java.lang.String getOutboundBaCampaign ()

Gets the value of the outboundBaCampaign property.

Returns:

possible object is [java.lang.String](#)

java.lang.String getOutboundBaCustomerNumber ()

Gets the value of the outboundBaCustomerNumber property.

Returns:

possible object is [java.lang.String](#)

java.lang.String getOutboundBaStatus ()

Gets the value of the outboundBaStatus property.

Returns:

possible object is [java.lang.String](#)

java.lang.String getPrecisionQueueId ()

Gets the value of the precisionQueueId property.

Returns:

possible object is [java.lang.String](#)

java.lang.String getPrecisionQueueName ()

Gets the value of the precisionQueueName property.

Returns:

possible object is [java.lang.String](#)

java.lang.String getProactiveRule ()

Gets the value of the proactiveRule property.

Returns:

possible object is [java.lang.String](#)

java.lang.String getQueueId ()

Gets the value of the queueId property.

Returns:

possible object is [java.lang.String](#)

java.lang.String getQueueName ()

Gets the value of the queueName property.

Returns:

possible object is [java.lang.String](#)

java.lang.String getSkillGroupId ()

Gets the value of the skillGroupId property.

Returns:

possible object is [java.lang.String](#)

java.lang.String getSkillGroupName ()

Gets the value of the skillGroupName property.

Returns:

possible object is [java.lang.String](#)

XMLGregorianCalendar getStartDateTime ()

Gets the value of the startDateTime property.

Returns:

possible object is [java.lang.String](#)

java.lang.String getSubchannel ()

Gets the value of the subchannel property.

Returns:

possible object is [java.lang.String](#)

java.lang.String getTenantId ()

Gets the value of the tenantId property.

Returns:

possible object is [java.lang.String](#)

java.lang.String getTransferCode ()

Gets the value of the transferCode property.

Returns:

possible object is [java.lang.String](#)

java.lang.String getTransferOut ()

Gets the value of the transferOut property.

Returns:

possible object is [java.lang.String](#)

Integer getWorkTime ()

Gets the value of the workTime property.

Returns:

possible object is [Integer](#)

Integer getWrapTime ()

Gets the value of the wrapTime property.

Returns:

possible object is [Integer](#)

java.lang.String getWrapUpData ()

Gets the value of the wrapUpData property.

Returns:

possible object is [java.lang.String](#)

void setAgentFirstName (java.lang.String value)

Sets the value of the agentFirstName property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setAgentId (Integer value)

Sets the value of the agentId property.

Parameters:

<i>value</i>	allowed object is Integer
--------------	---

void setAgentLastName (java.lang.String value)

Sets the value of the agentLastName property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setAgentLoginId (java.lang.String value)

Sets the value of the agentLoginId property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setAgentLoginName (java.lang.String value)

Sets the value of the agentLoginName property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setAgentTeamId (java.lang.String value)

Sets the value of the agentTeamId property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setAgentTeamName (java.lang.String value)

Sets the value of the agentTeamName property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setAni (java.lang.String value)

Sets the value of the ani property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setCallKey1 (Long value)

Sets the value of the callKey1 property.

Parameters:

<i>value</i>	allowed object is Long
--------------	--

void setCallKey2 (Long value)

Sets the value of the callKey2 property.

Parameters:

<i>value</i>	allowed object is Long
--------------	--

void setCallKey3 (java.lang.String value)

Sets the value of the callKey3 property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setCallKey4 (java.lang.String value)

Sets the value of the callKey4 property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setCallKey5 (java.lang.String value)

Sets the value of the callKey5 property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setCallReason (java.lang.String value)

Sets the value of the callReason property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setCallTypeName (java.lang.String value)

Sets the value of the callTypeName property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setChannel (java.lang.String value)

Sets the value of the channel property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setChannelOrigin (java.lang.String value)

Sets the value of the channelOrigin property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setComplianceCustomAttributeColors (java.lang.String *value*)

Sets the value of the complianceCustomAttributeColors property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setComplianceEvent (java.lang.String *value*)

Sets the value of the complianceEvent property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setComplianceTag (Object *value*)

Sets the value of the complianceTag property.

Parameters:

<i>value</i>	allowed object is Object
--------------	--

void setCustomer (java.lang.String *value*)

Sets the value of the customer property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setCustomerId (java.lang.String *value*)

Sets the value of the customerId property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setEmailAddress (java.lang.String *value*)

Sets the value of the emailAddress property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setEmailSubject (java.lang.String *value*)

Sets the value of the emailSubject property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setEndDateTime (XMLGregorianCalendar *value*)

Sets the value of the endDateTime property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setFcrFlag (java.lang.String value)

Sets the value of the fcrFlag property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setHandleTime (Integer value)

Sets the value of the handleTime property.

Parameters:

<i>value</i>	allowed object is Integer
--------------	---

void setHoldFlag (java.lang.String value)

Sets the value of the holdFlag property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setHoldTime (Integer value)

Sets the value of the holdTime property.

Parameters:

<i>value</i>	allowed object is Integer
--------------	---

void setKnowledgeSessionId (java.lang.String value)

Sets the value of the knowledgeSessionId property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setKnowledgeUsed (java.lang.String value)

Sets the value of the knowledgeUsed property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setLanguage (java.lang.String value)

Sets the value of the language property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setOutboundBaAccountNumber (java.lang.String value)

Sets the value of the outboundBaAccountNumber property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setOutboundBaCampaign (java.lang.String value)

Sets the value of the outboundBaCampaign property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setOutboundBaCustomerNumber (java.lang.String *value*)

Sets the value of the outboundBaCustomerNumber property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setOutboundBaStatus (java.lang.String *value*)

Sets the value of the outboundBaStatus property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setPrecisionQueueId (java.lang.String *value*)

Sets the value of the precisionQueueId property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setPrecisionQueueName (java.lang.String *value*)

Sets the value of the precisionQueueName property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setProactiveRule (java.lang.String *value*)

Sets the value of the proactiveRule property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setQueueId (java.lang.String *value*)

Sets the value of the queueId property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setQueueName (java.lang.String *value*)

Sets the value of the queueName property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setSkillGroupId (java.lang.String *value*)

Sets the value of the skillGroupId property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setSkillGroupName (java.lang.String value)

Sets the value of the skillGroupName property.

Parameters:

value	allowed object is java.lang.String
-------	--

void setStartDateTime (XMLGregorianCalendar value)

Sets the value of the startDateTime property.

Parameters:

value	allowed object is java.lang.String
-------	--

void setSubchannel (java.lang.String value)

Sets the value of the subchannel property.

Parameters:

value	allowed object is java.lang.String
-------	--

void setTenantId (java.lang.String value)

Sets the value of the tenantId property.

Parameters:

value	allowed object is java.lang.String
-------	--

void setTransferCode (java.lang.String value)

Sets the value of the transferCode property.

Parameters:

value	allowed object is java.lang.String
-------	--

void setTransferOut (java.lang.String value)

Sets the value of the transferOut property.

Parameters:

value	allowed object is java.lang.String
-------	--

void setWorkTime (Integer value)

Sets the value of the workTime property.

Parameters:

value	allowed object is Integer
-------	---

void setWrapTime (Integer value)

Sets the value of the wrapTime property.

Parameters:

value	allowed object is Integer
-------	---

void setWrapUpData (java.lang.String value)

Sets the value of the wrapUpData property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

substatus	Information about the substatus of the activity.	L10NString
assigned	Information about the assignment of the activity.	Assigned

Member Function Documentation

[Assigned](#) [getAssigned](#) ()

Gets the value of the assigned property.

Returns:

possible object is [Assigned](#)

java.lang.String [getDisplayValue](#) ()

Gets the value of the displayValue property.

Returns:

possible object is [java.lang.String](#)

[L10NString](#) getSubstatus ()

Gets the value of the substatus property.

Returns:

possible object is [L10NString](#)

java.lang.String getValue ()

Gets the value of the value property.

Returns:

possible object is [java.lang.String](#)

void setAssigned ([Assigned](#) value)

Sets the value of the assigned property.

Parameters:

<i>value</i>	allowed object is Assigned
--------------	--

void setDisplayValue (java.lang.String value)

Sets the value of the displayValue property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setSubstatus ([L10NString](#) value)

Sets the value of the substatus property.

Parameters:

<i>value</i>	allowed object is L10NString
--------------	--

void setValue (java.lang.String value)

Sets the value of the value property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

[Assigned](#) [getAssigned](#) ()

Gets the value of the assigned property.

Returns:

possible object is [Assigned](#)

java.lang.String [getDisplayValue](#) ()

Gets the value of the displayValue property.

Returns:

possible object is [java.lang.String](#)

[L10NString](#) getSubstatus ()

Gets the value of the substatus property.

Returns:

possible object is [L10NString](#)

java.lang.String getValue ()

Gets the value of the value property.

Returns:

possible object is [java.lang.String](#)

void setAssigned ([Assigned](#) value)

Sets the value of the assigned property.

Parameters:

<i>value</i>	allowed object is Assigned
--------------	--

void setDisplayValue (java.lang.String value)

Sets the value of the displayValue property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setSubstatus ([L10NString](#) value)

Sets the value of the substatus property.

Parameters:

<i>value</i>	allowed object is L10NString
--------------	--

void setValue (java.lang.String value)

Sets the value of the value property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

Member Function Documentation

[DateAndUser](#) [getCreated](#) ()

Gets the value of the created property.

Returns:

possible object is [DateAndUser](#)

long [getId](#) ()

Gets the value of the id property.

Returns:

possible object is [Long](#)

[DateAndUser](#) getLastModified ()

Gets the value of the lastModified property.

Returns:

possible object is [DateAndUser](#)

java.lang.String getName ()

Gets the value of the name property.

Returns:

possible object is [java.lang.String](#)

BigInteger getOrder ()

Gets the value of the order property.

Returns:

possible object is [BigInteger](#)

void setCreated ([DateAndUser](#) value)

Sets the value of the created property.

Parameters:

<i>value</i>	allowed object is DateAndUser
--------------	---

void setId (long value)

Sets the value of the id property.

Parameters:

<i>value</i>	allowed object is Long
--------------	--

void setLastModified ([DateAndUser](#) value)

Sets the value of the lastModified property.

Parameters:

<i>value</i>	allowed object is DateAndUser
--------------	---

void setName (java.lang.String value)

Sets the value of the name property.

Parameters:

<i>value</i>	allowed object is java.lang.String

`model/v12/xsd/mail/issue type.xsd`

Name	Description	Type
<code>subject</code>	Subject details	Subject

Member Function Documentation

`java.util.List<Subject> getSubject ()`

Gets the value of the subject property.

This accessor method returns a reference to the live list, not a snapshot. Therefore any modification you make to the returned list will be present inside the JAXB object. This is why there is not a `set` method for the subject property.

For example, to add a new item, do as follows:

```
getSubject ().add(newItem);
```

Objects of the following type(s) are allowed in the list [Subject](#)

Tag

This schema contains tag type details.

XML Schema File

model/v15/xsd/kb/tag_category.xsd

Name	Description	Type
id	ID of the tag.	Long
name	Name of the tag.	String

Member Function Documentation

long getId ()

Gets the value of the id property.

Returns:

possible object is [Long](#)

java.lang.String getName ()

Gets the value of the name property.

Returns:

possible object is [java.lang.String](#)

void setId (long value)

Sets the value of the id property.

Parameters:

<i>value</i>	allowed object is Long
--------------	--

void setName (java.lang.String value)

Sets the value of the name property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

TagCategories Class Reference

Detailed Description

Tag Categories

This schema contains tag categories type details.

XML Schema File

model/v15/xsd/kb/tag_category.xsd

Name	Description	Type
link	Link to this Tag Category.	Link
language	Language.	Language
tag	One or more instances of TagCategory .	TagCategory

Member Function Documentation

[Language](#) `getLanguage ()`

Gets the value of the language property.

Returns:

possible object is [Language](#)

[Link](#) `getLink ()`

Gets the value of the link property.

Returns:

possible object is [Link](#)

`java.util.List<TagCategory> getTagCategory ()`

Gets the value of the tagCategory property.

This accessor method returns a reference to the live list, not a snapshot. Therefore any modification you make to the returned list will be present inside the JAXB object. This is why there is not a `set` method for the tagCategory property.

For example, to add a new item, do as follows:

```
getTagCategory().add(newItem);
```

Objects of the following type(s) are allowed in the list [TagCategory](#)

void setLanguage ([Language](#) value)

Sets the value of the language property.

Parameters:

<i>value</i>	allowed object is Language
--------------	--

void setLink ([Link](#) value)

Sets the value of the link property.

Parameters:

<i>value</i>	allowed object is Link
--------------	--

Name	Description	Type
name	Name of the tag category.	String
tagGroup	One or more instances of TagGroup .	TagGroup
tag	One or more instances of Tag .	Tag
created	Date the Tag Category was created.	DateAndTime
lastModified	Date of last modification.	DateAndTime

Member Function Documentation

[DateAndTime](#) [getCreated](#) ()

Gets the value of the created property.

Returns:

possible object is [DateAndTime](#)

[DateAndTime](#) [getLastModified](#) ()

Gets the value of the lastModified property.

Returns:

possible object is [DateAndTime](#)

java.lang.String getName ()

Gets the value of the name property.

Returns:

possible object is [java.lang.String](#)

java.util.List<Tag> getTag ()

Gets the value of the tag property.

This accessor method returns a reference to the live list, not a snapshot. Therefore any modification you make to the returned list will be present inside the JAXB object. This is why there is not a `set` method for the tag property.

For example, to add a new item, do as follows:

```
getTag().add(newItem);
```

Objects of the following type(s) are allowed in the list [Tag](#)

java.util.List<TagGroup> getTagGroup ()

Gets the value of the tagGroup property.

This accessor method returns a reference to the live list, not a snapshot. Therefore any modification you make to the returned list will be present inside the JAXB object. This is why there is not a `set` method for the tagGroup property.

For example, to add a new item, do as follows:

```
getTagGroup().add(newItem);
```

Objects of the following type(s) are allowed in the list [TagGroup](#)

void setCreated ([DateAndTime](#) value)

Sets the value of the created property.

Parameters:

<i>value</i>	allowed object is DateAndTime
--------------	---

void setLastModified ([DateAndTime](#) value)

Sets the value of the lastModified property.

Parameters:

<i>value</i>	allowed object is DateAndTime
--------------	---

void setName (java.lang.String value)

Sets the value of the name property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

Detailed Description

Topic Schema

This schema contains [Topic](#) type details.

XML Schema File

model/v12/xsd/kb/topic.xsd

Name	Description	Type
id	ID of the topic	Long
link	Relational links self & links to other resources, the topic is used in.	Link
lastModified	Last modification details of the topic	Created
created	Creation details of the topic	Created
department	ID, name and link of the	Department

	department, which the topic belongs to	
parentTopic	ID of the parent topic, which the topic belongs to.	Topic
name	name of the topic	String
language	ID, code, label of language	Language
description	description of the topic	String
imageUrl	ImageUrl of the topic	String
isTranslatable	field to convey if the topic is translatable	Boolean
childTopics	collection of sub-topics within the topic	Topics
autogenerated	contains auto generated topic type details.	Autogenerated
customAttributes	Custom attributes of the topic	CustomAttributes

Member Function Documentation

[Autogenerated](#) getAutogenerated ()

Gets the value of the autogenerated property.

Returns:

possible object is [Autogenerated](#)

[Topics](#) getChildTopics ()

Gets the value of the childTopics property.

Returns:

possible object is [Topics](#)

[DateAndTime](#) getCreated ()

Gets the value of the created property.

Returns:

possible object is [DateAndTime](#)

[CustomAttributes](#) getCustomAttributes ()

Gets the value of the customAttributes property.

Returns:

possible object is [CustomAttributes](#)

[Department](#) getDepartment ()

Gets the value of the department property.

Returns:

possible object is [Department](#)

java.lang.String getDescription ()

Gets the value of the description property.

Returns:

possible object is [java.lang.String](#)

long getId ()

Gets the value of the id property.

Returns:

possible object is [Long](#)

java.lang.String getImageUrl ()

Gets the value of the imageUrl property.

Returns:

possible object is [java.lang.String](#)

[Language](#) getLanguage ()

Gets the value of the language property.

Returns:

possible object is [Language](#)

[DateAndTime](#) getLastModified ()

Gets the value of the lastModified property.

Returns:

possible object is [DateAndTime](#)

java.util.List<[Link](#)> getLink ()

Gets the value of the link property.

This accessor method returns a reference to the live list, not a snapshot. Therefore any modification you make to the returned list will be present inside the JAXB object. This is why there is not a `set` method for the link property.

For example, to add a new item, do as follows:

```
getLink().add(newItem);
```

Objects of the following type(s) are allowed in the list [Link](#)

java.lang.String getName ()

Gets the value of the name property.

Returns:

possible object is [java.lang.String](#)

[Topic](#) getParentTopic ()

Gets the value of the parentTopic property.

Returns:

possible object is [Topic](#)

Boolean isIsTranslatable ()

Gets the value of the isTranslatable property.

Returns:

possible object is [Boolean](#)

void setAutogenerated ([Autogenerated](#) value)

Sets the value of the autogenerated property.

Parameters:

<i>value</i>	allowed object is Autogenerated
--------------	---

void setChildTopics ([Topics](#) value)

Sets the value of the childTopics property.

Parameters:

<i>value</i>	allowed object is Topics
--------------	--

void setCreated ([DateAndTime](#) value)

Sets the value of the created property.

Parameters:

<i>value</i>	allowed object is DateAndTime
--------------	---

void setCustomAttributes ([CustomAttributes](#) value)

Sets the value of the customAttributes property.

Parameters:

<i>value</i>	allowed object is CustomAttributes
--------------	--

void setDepartment ([Department](#) value)

Sets the value of the department property.

Parameters:

<i>value</i>	allowed object is Department
--------------	--

void setDescription (java.lang.String value)

Sets the value of the description property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setId (long value)

Sets the value of the id property.

Parameters:

<i>value</i>	allowed object is Long
--------------	--

void setImageUrl (java.lang.String value)

Sets the value of the imageUrl property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setIsTranslatable (Boolean *value*)

Sets the value of the isTranslatable property.

Parameters:

<i>value</i>	allowed object is Boolean
--------------	---

void setLanguage ([Language](#) *value*)

Sets the value of the language property.

Parameters:

<i>value</i>	allowed object is Language
--------------	--

void setLastModified ([DateAndTime](#) *value*)

Sets the value of the lastModified property.

Parameters:

<i>value</i>	allowed object is DateAndTime
--------------	---

void setName (java.lang.String *value*)

Sets the value of the name property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setParentTopic ([Topic](#) *value*)

Sets the value of the parentTopic property.

Parameters:

<i>value</i>	allowed object is Topic
--------------	---

Topics Schema

This schema contains [Topics](#) type details.

XML Schema File

model/v12/xsd/kb/topic.xsd

Name	Description	Type
link	`self' link	Link
paginationInfo	Pagination details of topics	PaginationInfo
topic	details of each topic, contained in this collection of topics	Topic
`count'	Total number of topics within this collection of topics	Int

Member Function Documentation

int [getCount](#) ()

Gets the value of the count property.

Returns:

possible object is [Integer](#)

[Link](#) [getLink](#) ()

Gets the value of the link property.

Returns:

possible object is [Link](#)

[PaginationInfo](#) [getPaginationInfo](#) ()

Gets the value of the paginationInfo property.

Returns:

possible object is [PaginationInfo](#)

java.util.List<[Topic](#)> getTopic ()

Gets the value of the topic property.

This accessor method returns a reference to the live list, not a snapshot. Therefore any modification you make to the returned list will be present inside the JAXB object. This is why there is not a `set` method for the topic property.

For example, to add a new item, do as follows:

```
getTopic().add(newItem);
```

Objects of the following type(s) are allowed in the list [Topic](#)

void setCount (int *value*)

Sets the value of the count property.

Parameters:

<i>value</i>	allowed object is Integer
--------------	---

void setLink ([Link](#) *value*)

Sets the value of the link property.

Parameters:

<i>value</i>	allowed object is Link
--------------	--

void setPaginationInfo ([PaginationInfo](#) *value*)

Sets the value of the paginationInfo property.

Parameters:

<i>value</i>	allowed object is PaginationInfo
--------------	--

TransferActivityToDepartmentExamples Class Reference

Detailed Description

Examples for transfer activities to department

Example 1 - Transfer an activity to a department

This example demonstrates the following:

- Transferring a single activity to a department.

XML

Request

Method	URL
PUT	/ws/v12/interaction/activity/transfer?department=1001

Request headers

Name	Value
X-egain-session	Valid session ID
Accept	application/xml
Content-Type	application/xml
Accept-Language	en-US

Request body:

```
<?xml version="1.0" encoding="UTF-8"?><activities xmlns="http://bindings.egain.com/ws/model/v12/gen/interaction/activity"> <activity id="1217"> <lastModified date="2014-11-24T09:09:08.000Z" /> </activity></activities>
```

Response:

HTTP/1.1 204 No Content

Response headers

Name	Value
X-egain-session	current session ID
Content-Type	application/xml

JSON

Request

Method	URL
PUT	/ws/v12/interaction/activity

	/transfer?department=1001
--	---------------------------

Request headers

Name	Value
X-egain-session	Valid session ID
Accept	application/json
Content-Type	application/json
Accept-Language	en-US

Request body:

```
{ "activity": { "id": "1217", "lastModified": { "date": "2014-11-24T09:09:08.000Z" } } }
```

Response:

HTTP/1.1 204 No Content

Response headers

Name	Value
X-egain-session	current session ID
Content-Type	application/json

Example 2 - Transfer multiple activities to a department

This example demonstrates the following:

- Transferring multiple activities to a department. In this example, two activities are transferred to a department.
- Using the following query parameters: "reassign" and "unpin".

XML

Request

Method	URL
PUT	/ws/v12/interaction/activity/transfer?department=1002&reassign=yes&unpin=yes

Request headers

Name	Value
X-egain-session	Valid session ID
Accept	application/xml
Content-Type	application/xml
Accept-Language	en-US

Request body:

```
<?xml version="1.0" encoding="UTF-8"?><activities
xmlns="http://bindings.egain.com/ws/model/v12/gen/interaction/activity"> <activity id="1217">
<lastModified date="2014-11-24T09:09:08.000Z" /> </activity> <activity id="1220">
<lastModified date="2014-12-20T09:16:40.000Z" /> </activity></activities>
```

Response:

HTTP/1.1 204 No Content

Response headers

Name	Value
X-egain-session	current session ID
Content-Type	application/xml

JSON

Request

Method	URL
PUT	/ws/v12/interaction/activity /transfer?department=1002&re assign=yes&unpin=yes

Request headers

Name	Value
X-egain-session	Valid session ID
Accept	application/json
Content-Type	application/json
Accept-Language	en-US

Request body:

```
{ "activity": [ { "id": "1217", "lastModified": { "date": "2014-11-24T09:09:08.000Z" } }, { "id": "1220", "lastModified": { "date": "2014-12-20T09:16:40.000Z" } } ] }
```

Response:

HTTP/1.1 204 No Content

Response headers

Name	Value
X-egain-session	current session ID
Content-Type	application/json

TransferActivityToQueueExamples Class Reference

Detailed Description

Examples for transfer activities to queue

Example 1 - Transfer an activity to queue

This example demonstrates the following:

- Transferring a single activity to a queue.

XML

Request

Method	URL
PUT	/ws/v12/interaction/activity/transfer?queue=1001

Request headers

Name	Value
X-egain-session	Valid session ID
Accept	application/xml
Content-Type	application/xml
Accept-Language	en-US

Request body:

```
<?xml version="1.0" encoding="UTF-8"?><activities xmlns="http://bindings.egain.com/ws/model/v12/gen/interaction/activity"> <activity id="1217"> <lastModified date="2014-11-24T09:09:08.000Z" /> </activity></activities>
```

Response:

HTTP/1.1 204 No Content

Response headers

Name	Value
X-egain-session	current session ID
Content-Type	application/xml

JSON

Request

Method	URL
PUT	/ws/v12/interaction/activity

	/transfer?queue=1001
--	----------------------

Request headers

Name	Value
X-egain-session	Valid session ID
Accept	application/json
Content-Type	application/json
Accept-Language	en-US

Request body:

```
{ "activity": { "id": "1217", "lastModified": { "date": "2014-11-24T09:09:08.000Z" } } }
```

Response:

HTTP/1.1 204 No Content

Response headers

Name	Value
X-egain-session	current session ID
Content-Type	application/json

Example 2 - Transfer multiple activities to a queue

This example demonstrates the following:

- Transferring multiple activities to a queue. In this example, two activities are transferred to a queue.
- Using the following query parameters: "reassign" and "unpin".

XML

Request

Method	URL
PUT	/ws/v12/interaction/activity/transfer?queue=1002&reassign=yes&unpin=yes

Request headers

Name	Value
X-egain-session	Valid session ID
Accept	application/xml

 - void [setValue](#) (java.lang.String value)
-

Detailed Description

Type Schema

This schema has the definition of [Type](#) of an activity.

XML Schema File

model/v12/xsd/interaction/activity.xsd

Name	Description	Type
value	Name of the type of the activity.	String
displayValue	Localized value of the name of the type of the activity.	String
subtype	Information about the subtype of the activity.	L10NString

Member Function Documentation

java.lang.String [getDisplayValue](#) ()

Gets the value of the displayValue property.

Returns:

possible object is [java.lang.String](#)

[L10NString](#) [getSubtype](#) ()

Gets the value of the subtype property.

Returns:

possible object is [L10NString](#)

java.lang.String [getValue](#) ()

Gets the value of the value property.

Returns:

possible object is [java.lang.String](#)

void setDisplayValue (java.lang.String value)

Sets the value of the displayValue property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setSubtype ([L10NString](#) value)

Sets the value of the subtype property.

Parameters:

<i>value</i>	allowed object is L10NString
--------------	--

void setValue (java.lang.String value)

Sets the value of the value property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

Detailed Description

Type Schema

Description of the elements used in [Type](#) schema.

XML Schema File

model/v15/xsd/interaction/contact_point.xsd

Name	Description	Type
value	Internal value of the type of contact point	String
displayValue	Display value (localized) of the type of contact point	String
One of the following elements: email postal phone website social	email details if this Type element is for email contact point postal details if this Type element is for postal contact point phone details if this Type element is for phone contact point website details if this Type element is for website contact point social details if this Type element is for social contact point	Email Postal Phone Website Social

Member Function Documentation

java.lang.String getDisplayValue ()

Gets the value of the displayValue property.

Returns:

possible object is [java.lang.String](#)

[Email](#) getEmail ()

Gets the value of the email property.

Returns:

possible object is [Email](#)

[Phone](#) getPhone ()

Gets the value of the phone property.

Returns:

possible object is [Phone](#)

[Postal](#) getPostal ()

Gets the value of the postal property.

Returns:

possible object is [Postal](#)

[Social](#) getSocial ()

Gets the value of the social property.

Returns:

possible object is [Social](#)

java.lang.String getValue ()

Gets the value of the value property.

Returns:

possible object is [java.lang.String](#)

[Website](#) getWebsite ()

Gets the value of the website property.

Returns:

possible object is [Website](#)

void setDisplayValue (java.lang.String value)

Sets the value of the displayValue property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setEmail ([Email](#) *value*)

Sets the value of the email property.

Parameters:

<i>value</i>	allowed object is Email
--------------	---

void setPhone ([Phone](#) *value*)

Sets the value of the phone property.

Parameters:

<i>value</i>	allowed object is Phone
--------------	---

void setPostal ([Postal](#) *value*)

Sets the value of the postal property.

Parameters:

<i>value</i>	allowed object is Postal
--------------	--

void setSocial ([Social](#) *value*)

Sets the value of the social property.

Parameters:

<i>value</i>	allowed object is Social
--------------	--

void setValue (java.lang.String *value*)

Sets the value of the value property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setWebsite ([Website](#) *value*)

Sets the value of the website property.

Parameters:

<i>value</i>	allowed object is Website
--------------	---

Detailed Description

Type Schema

Description of the elements used in [Type](#) schema.

XML Schema File

model/v15/xsd/interaction/customer.xsd

Name	Description	Type
value	Customer type value	String
displayValue	Localized customer type value	String
group	Details specific to group customer	GroupInfo
corporate	Details specific to corporate customer	CorporateInfo

Member Function Documentation

[CorporateInfo](#) [getCorporate](#) ()

Gets the value of the corporate property.

Returns:

possible object is [CorporateInfo](#)

java.lang.String [getDisplayValue](#) ()

Gets the value of the displayValue property.

Returns:

possible object is [java.lang.String](#)

[GroupInfo](#) [getGroup](#) ()

Gets the value of the group property.

Returns:

possible object is [GroupInfo](#)

java.lang.String getValue ()

Gets the value of the value property.

Returns:

possible object is [java.lang.String](#)

void setCorporate ([CorporateInfo](#) value)

Sets the value of the corporate property.

Parameters:

<i>value</i>	allowed object is CorporateInfo
--------------	---

void setDisplayValue (java.lang.String value)

Sets the value of the displayValue property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setGroup ([GroupInfo](#) value)

Sets the value of the group property.

Parameters:

<i>value</i>	allowed object is GroupInfo
--------------	---

void setValue (java.lang.String value)

Sets the value of the value property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

corporate	Details specific to corporate customer	CorporateInfo

Member Function Documentation

[CorporateInfo](#) [getCorporate](#) ()

Gets the value of the corporate property.

Returns:

possible object is [CorporateInfo](#)

java.lang.String [getDisplayValue](#) ()

Gets the value of the displayValue property.

Returns:

possible object is [java.lang.String](#)

[GroupInfo](#) [getGroup](#) ()

Gets the value of the group property.

Returns:

possible object is [GroupInfo](#)

java.lang.String getValue ()

Gets the value of the value property.

Returns:

possible object is [java.lang.String](#)

void setCorporate ([CorporateInfo](#) value)

Sets the value of the corporate property.

Parameters:

<i>value</i>	allowed object is CorporateInfo
--------------	---

void setDisplayValue (java.lang.String value)

Sets the value of the displayValue property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setGroup ([GroupInfo](#) value)

Sets the value of the group property.

Parameters:

<i>value</i>	allowed object is GroupInfo
--------------	---

void setValue (java.lang.String value)

Sets the value of the value property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

Member Function Documentation

java.lang.String getDisplayValue ()

Gets the value of the displayValue property.

Returns:

possible object is [java.lang.String](#)

[Email](#) getEmail ()

Gets the value of the email property.

Returns:

possible object is [Email](#)

[Phone](#) getPhone ()

Gets the value of the phone property.

Returns:

possible object is [Phone](#)

[Postal](#) getPostal ()

Gets the value of the postal property.

Returns:

possible object is [Postal](#)

[Social](#) getSocial ()

Gets the value of the social property.

Returns:

possible object is [Social](#)

java.lang.String getValue ()

Gets the value of the value property.

Returns:

possible object is [java.lang.String](#)

[Website](#) getWebsite ()

Gets the value of the website property.

Returns:

possible object is [Website](#)

void setDisplayValue (java.lang.String value)

Sets the value of the displayValue property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setEmail ([Email](#) *value*)

Sets the value of the email property.

Parameters:

<i>value</i>	allowed object is Email
--------------	---

void setPhone ([Phone](#) *value*)

Sets the value of the phone property.

Parameters:

<i>value</i>	allowed object is Phone
--------------	---

void setPostal ([Postal](#) *value*)

Sets the value of the postal property.

Parameters:

<i>value</i>	allowed object is Postal
--------------	--

void setSocial ([Social](#) *value*)

Sets the value of the social property.

Parameters:

<i>value</i>	allowed object is Social
--------------	--

void setValue (java.lang.String *value*)

Sets the value of the value property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setWebsite ([Website](#) *value*)

Sets the value of the website property.

Parameters:

<i>value</i>	allowed object is Website
--------------	---

Type Schema

This schema has the definition of [Type](#) of an activity.

XML Schema File

model/v15/xsd/interaction/activity.xsd

Name	Description	Type
value	Name of the type of the activity.	String
displayValue	Localized value of the name of the type of the activity.	String
subtype	Information about the subtype of the activity.	L10NString

Member Function Documentation

java.lang.String [getDisplayValue](#) ()

Gets the value of the displayValue property.

Returns:

possible object is [java.lang.String](#)

[L10NString](#) [getSubtype](#) ()

Gets the value of the subtype property.

Returns:

possible object is [L10NString](#)

java.lang.String [getValue](#) ()

Gets the value of the value property.

Returns:

possible object is [java.lang.String](#)

void setDisplayValue (java.lang.String value)

Sets the value of the displayValue property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setSubtype ([L10NString](#) value)

Sets the value of the subtype property.

Parameters:

<i>value</i>	allowed object is L10NString
--------------	--

void setValue (java.lang.String value)

Sets the value of the value property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

Detailed Description

Documentation to be added when the Authoring API is released.

Member Function Documentation

long getId ()

Gets the value of the id property.

[Link](#) getLink ()

Gets the value of the link property.

Returns:

possible object is [Link](#)

java.lang.String getName ()

Gets the value of the name property.

Returns:

possible object is [java.lang.String](#)

void setId (long value)

Sets the value of the id property.

void setLink ([Link](#) value)

Sets the value of the link property.

Parameters:

<i>value</i>	allowed object is Link
--------------	--

void setName (java.lang.String value)

Sets the value of the name property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

Detailed Description

User Schema

This schema contains [User](#) type details.

XML Schema File

model/v15/xsd/platform/user.xsd

Name	Description	Type
id	ID of the user	Long
name	Name of the user	String
firstName	First name of the user	String
lastName	Last name of the user	String
link	self link	Link
customAttributes	This contains the custom attributes of the user.	CustomAttributes

Member Function Documentation

[CustomAttributes](#) [getCustomAttributes](#) ()

Gets the value of the customAttributes property.

Returns:

possible object is [CustomAttributes](#)

java.lang.String [getFirstName](#) ()

Gets the value of the firstName property.

Returns:

possible object is [java.lang.String](#)

long getId ()

Gets the value of the id property.

Returns:

possible object is [Long](#)

java.lang.String getLastName ()

Gets the value of the lastName property.

Returns:

possible object is [java.lang.String](#)

[Link](#) getLink ()

Gets the value of the link property.

Returns:

possible object is [Link](#)

java.lang.String getName ()

Gets the value of the name property.

Returns:

possible object is [java.lang.String](#)

void setCustomAttributes ([CustomAttributes](#) value)

Sets the value of the customAttributes property.

Parameters:

<i>value</i>	allowed object is CustomAttributes
--------------	--

void setFirstName (java.lang.String value)

Sets the value of the firstName property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setId (long value)

Sets the value of the id property.

Parameters:

<i>value</i>	allowed object is Long
--------------	--

void setLastName (java.lang.String value)

Sets the value of the lastName property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setLink ([Link](#) value)

Sets the value of the link property.

Parameters:

<i>value</i>	allowed object is Link
--------------	--

void setName (java.lang.String value)

Sets the value of the name property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

customAttributes	This contains the custom attributes of the user.	CustomAttributes

Member Function Documentation

[CustomAttributes](#) [getCustomAttributes](#) ()

Gets the value of the customAttributes property.

Returns:

possible object is [CustomAttributes](#)

java.lang.String [getFirstName](#) ()

Gets the value of the firstName property.

Returns:

possible object is [java.lang.String](#)

long getId ()

Gets the value of the id property.

java.lang.String getLastName ()

Gets the value of the lastName property.

Returns:

possible object is [java.lang.String](#)

[Link](#) getLink ()

Gets the value of the link property.

Returns:

possible object is [Link](#)

java.lang.String getName ()

Gets the value of the name property.

Returns:

possible object is [java.lang.String](#)

void setCustomAttributes ([CustomAttributes](#) value)

Sets the value of the customAttributes property.

Parameters:

<i>value</i>	allowed object is CustomAttributes
--------------	--

void setFirstName (java.lang.String value)

Sets the value of the firstName property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setId (long value)

Sets the value of the id property.

void setLastName (java.lang.String value)

Sets the value of the lastName property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setLink ([Link](#) value)

Sets the value of the link property.

Parameters:

<i>value</i>	allowed object is Link
--------------	--

void setName (java.lang.String *value*)

Sets the value of the name property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

Users Class Reference

Public Member Functions

- `java.util.List<User> getUser ()`
-

Detailed Description

Users Schema

This schema contains definition of [Users](#).

XML Schema File

`model/v12/xsd/platform/user.xsd`

Name	Description	Type
<code>user</code>	Has the details of the user. Can have multiple 'user' nodes.	User

Member Function Documentation

`java.util.List<User> getUser ()`

Gets the value of the user property.

This accessor method returns a reference to the live list, not a snapshot. Therefore any modification you make to the returned list will be present inside the JAXB object. This is why there is not a `set` method for the user property.

For example, to add a new item, do as follows:

```
getUser ().add(newItem);
```

Objects of the following type(s) are allowed in the list [User](#)

Users Class Reference

Public Member Functions

- `java.util.List<User> getUser ()`
-

- [StagesList getBackwardStages \(\)](#)
- [StagesList getForwardStages \(\)](#)
- void [setBackwardStages \(StagesList value\)](#)
- void [setForwardStages \(StagesList value\)](#)

Detailed Description

User Stages Schema

This schema contains [UserStages](#) type details.

XML Schema File

model/v12/xsd/kb/article.xsd

Name	Description	Type
forwardStages	forward stages where a user has permission to move an article	StagesList
backwardStages	backward stages where a user has permission to move an article	StagesList

Member Function Documentation

[StagesList getBackwardStages \(\)](#)

Gets the value of the backwardStages property.

Returns:

possible object is [StagesList](#)

[StagesList getForwardStages \(\)](#)

Gets the value of the forwardStages property.

Returns:

possible object is [StagesList](#)

void [setBackwardStages \(StagesList value\)](#)

Sets the value of the backwardStages property.

Parameters:

<i>value</i>	allowed object is StagesList
--------------	--

void setForwardStages ([StagesList](#) *value*)

Sets the value of the forwardStages property.

Parameters:

<i>value</i>	allowed object is StagesList
--------------	--

UsertypeType Enum Reference

Detailed Description

Java class for [UsertypeType](#).

The following schema fragment specifies the expected content contained within this class.

```
<simpleType name="UsertypeType"> <restriction base="{http://www.w3.org/2001/XMLSchema}string">  
<enumeration value="agent"/> <enumeration value="customer"/> <enumeration value="unknown"/>  
</restriction></simpleType>
```

Detailed Description

Version Schema

This schema defines the response from the `meta/version` API. It includes an entry for every version of the web service API supported by this server.

XML Schema File

`model/v3/xsd/meta/version.xsd`

Name	Description	Type	Included?
<code>isDeprecated</code>	True if this version is deprecated.	boolean	Always
<code>name</code>	The name of the version, such as "v11".	string	Always
<code>schemaVersion</code>	The name of the associated schema version, such as "v3".	string	Always

Member Function Documentation

`java.lang.String getName ()`

Gets the value of the name property.

Returns:

possible object is [java.lang.String](#)

`java.lang.String getSchemaVersion ()`

Gets the value of the schemaVersion property.

Returns:

possible object is [java.lang.String](#)

boolean isIsDeprecated ()

Gets the value of the isDeprecated property.

void setIsDeprecated (boolean *value*)

Sets the value of the isDeprecated property.

void setName (java.lang.String *value*)

Sets the value of the name property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setSchemaVersion (java.lang.String *value*)

Sets the value of the schemaVersion property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

Detailed Description

Version Schema

This schema contains [Version](#) type details.

XML Schema File

model/v12/xsd/kb/article.xsd

Name	Description	Type
id	ID of the version	Long
link	Self link of version	Link
name	name of the the version	String
versionNumber	Version number of the version	Int
created	Creation details of the version	Created
lastModified	Last modification details of the version	Created
description	Description of the version	String
keywords	Vrticle keywords	String
summary	Vrticle summary	String
additionInfo	Addition info of the version	String
content	Content of the version	String
label	label of the article	String
availabilityDate	Availability date of version	DateTime
expirationDate	Expiration date of the version	DateTime
imageUrl	ImageUrl of the version	String
attachments	Attachments with the version	Attachments
articleType	Article type , by default 'General'	String
articleState	Four possible states of version : <ul style="list-style-type: none">• published• draft• transient• abandoned	String
translationStatus	This field tells whether the translation is up to date or whether the content needs to be translated. Values can be : upto date or out dated	String

Member Function Documentation

java.lang.String getAdditionalInfo ()

Gets the value of the additionalInfo property.

Returns:

possible object is [java.lang.String](#)

java.lang.String getArticleState ()

Gets the value of the articleState property.

Returns:

possible object is [java.lang.String](#)

java.lang.String getArticleType ()

Gets the value of the articleType property.

Returns:

possible object is [java.lang.String](#)

[Attachments](#) getAttachments ()

Gets the value of the attachments property.

Returns:

possible object is [Attachments](#)

XMLGregorianCalendar getAvailabilityDate ()

Gets the value of the availabilityDate property.

Returns:

possible object is [XMLGregorianCalendar](#)

[Editions](#) getAvailableEditions ()

Gets the value of the availableEditions property.

Returns:

possible object is [Editions](#)

java.lang.String getContent ()

Gets the value of the content property.

Returns:

possible object is [java.lang.String](#)

[DateAndTime](#) getCreated ()

Gets the value of the created property.

Returns:

possible object is [DateAndTime](#)

java.lang.String getDescription ()

Gets the value of the description property.

Returns:

possible object is [java.lang.String](#)

java.lang.String getExpirationDate ()

Gets the value of the expirationDate property.

Returns:

possible object is [java.lang.String](#)

long getId ()

Gets the value of the id property.

Returns:

possible object is [Long](#)

java.lang.String getImageUrl ()

Gets the value of the imageUrl property.

Returns:

possible object is [java.lang.String](#)

java.lang.String getKeywords ()

Gets the value of the keywords property.

Returns:

possible object is [java.lang.String](#)

java.lang.String getLabel ()

Gets the value of the label property.

Returns:

possible object is [java.lang.String](#)

[DateAndTime](#) getLastModified ()

Gets the value of the lastModified property.

Returns:

possible object is [DateAndTime](#)

[Link](#) getLink ()

Gets the value of the link property.

Returns:

possible object is [Link](#)

java.lang.String getName ()

Gets the value of the name property.

Returns:

possible object is [java.lang.String](#)

java.lang.String getSummary ()

Gets the value of the summary property.

Returns:

possible object is [java.lang.String](#)

java.lang.String getTranslationStatus ()

Gets the value of the translationStatus property.

Returns:

possible object is [java.lang.String](#)

Integer getVersionNumber ()

Gets the value of the versionNumber property.

Returns:

possible object is [Integer](#)

void setAdditionalInfo (java.lang.String value)

Sets the value of the additionalInfo property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setArticleState (java.lang.String value)

Sets the value of the articleState property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setArticleType (java.lang.String value)

Sets the value of the articleType property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setAttachments ([Attachments](#) value)

Sets the value of the attachments property.

Parameters:

<i>value</i>	allowed object is Attachments
--------------	---

void setAvailabilityDate (XMLGregorianCalendar value)

Sets the value of the availabilityDate property.

Parameters:

<i>value</i>	allowed object is XMLGregorianCalendar
--------------	--

void setAvailableEditions ([Editions](#) value)

Sets the value of the availableEditions property.

Parameters:

<i>value</i>	allowed object is Editions
--------------	--

void setContent (java.lang.String value)

Sets the value of the content property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setCreated ([DateAndTime](#) value)

Sets the value of the created property.

Parameters:

<i>value</i>	allowed object is DateAndTime
--------------	---

void setDescription (java.lang.String *value*)

Sets the value of the description property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setExpirationDate (java.lang.String *value*)

Sets the value of the expirationDate property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setId (long *value*)

Sets the value of the id property.

Parameters:

<i>value</i>	allowed object is Long
--------------	--

void setImageUrl (java.lang.String *value*)

Sets the value of the imageUrl property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setKeywords (java.lang.String *value*)

Sets the value of the keywords property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setLabel (java.lang.String *value*)

Sets the value of the label property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setLastModified ([DateAndTime](#) *value*)

Sets the value of the lastModified property.

Parameters:

<i>value</i>	allowed object is DateAndTime
--------------	---

void setLink ([Link](#) *value*)

Sets the value of the link property.

Parameters:

<i>value</i>	allowed object is Link
--------------	--

void setName (java.lang.String value)

Sets the value of the name property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setSummary (java.lang.String value)

Sets the value of the summary property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setTranslationStatus (java.lang.String value)

Sets the value of the translationStatus property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setVersionNumber (Integer value)

Sets the value of the versionNumber property.

Parameters:

<i>value</i>	allowed object is Integer
--------------	---

VersionResult Class Reference

Public Member Functions

- `java.util.List<Version> getVersion ()`
-

Detailed Description

VersionResult Schema

A [VersionResult](#) encapsulates a response from the `meta/version` API. It extends the [WSResult Schema](#).

XML Schema File

`model/v3/xsd/meta/versionResult.xsd`

Name	Description	Type	Included?
<code>version</code>	A list of zero or more Version instances.	Version	Always

Member Function Documentation

`java.util.List<Version> getVersion ()`

Gets the value of the version property.

This accessor method returns a reference to the live list, not a snapshot. Therefore any modification you make to the returned list will be present inside the JAXB object. This is why there is not a `set` method for the version property.

For example, to add a new item, do as follows:

```
getVersion().add(newItem);
```

Objects of the following type(s) are allowed in the list [Version](#)

Versions Class Reference

Public Member Functions

- int [getCount](#) ()
 - [Link](#) [getLink](#) ()
 - [PaginationInfo](#) [getPaginationInfo](#) ()
 - java.util.List< [Version](#) > [getVersion](#) ()
 - void [setCount](#) (int value)
 - void [setLink](#) ([Link](#) value)
 - void [setPaginationInfo](#) ([PaginationInfo](#) value)
-

Detailed Description

Versions Schema

This schema contains [Versions](#) type details.

XML Schema File

model/v12/xsd/kb/article.xsd

Name	Description	Type
count	Count of versions	Int
link	self link	Link
paginationInfo	Pagination details of Versions	PaginationInfo
version	Details of the version	Version

Member Function Documentation

int [getCount](#) ()

Gets the value of the count property.

Returns:

possible object is [Integer](#)

[Link](#) [getLink](#) ()

Gets the value of the link property.

Returns:

possible object is [Link](#)

[PaginationInfo](#) [getPaginationInfo](#) ()

Gets the value of the paginationInfo property.

Returns:

possible object is [PaginationInfo](#)

java.util.List<[Version](#)> getVersion ()

Gets the value of the version property.

This accessor method returns a reference to the live list, not a snapshot. Therefore any modification you make to the returned list will be present inside the JAXB object. This is why there is not a `set` method for the version property.

For example, to add a new item, do as follows:

```
getVersion().add(newItem);
```

Objects of the following type(s) are allowed in the list [Version](#)

void setCount (int *value*)

Sets the value of the count property.

Parameters:

<i>value</i>	allowed object is Integer
--------------	---

void setLink ([Link](#) *value*)

Sets the value of the link property.

Parameters:

<i>value</i>	allowed object is Link
--------------	--

void setPaginationInfo ([PaginationInfo](#) *value*)

Sets the value of the paginationInfo property.

Parameters:

<i>value</i>	allowed object is PaginationInfo
--------------	--

VisibleActivitiesToCustomerPage Class Reference

Detailed Description

Activities visible to a customer

The logged in customer will be able to see only the following types of activities:

- Email
 - All emails sent by the customer.
 - All emails sent to the customer. These emails will be visible to the customer only after they have been sent out by the application.
-
- Chat
 - Chat transcript is shown.

WebAttributes Class Reference

Public Member Functions

- java.util.List< [Actions](#) > [getActions](#) ()
 - [Actor](#) [getActor](#) ()
 - void [setActor](#) ([Actor](#) value)
-

Detailed Description

WebAttributes Schema

This schema has the definition of [WebAttributes](#).

XML Schema File

model/v15/xsd/interaction/activity.xsd

Name	Description	Type
actor	This has the details of whose actions created the activity.	Actor
actions	This has the details of the actions performed by the actor.	Actions

Member Function Documentation

java.util.List<[Actions](#)> [getActions](#) ()

Gets the value of the actions property.

This accessor method returns a reference to the live list, not a snapshot. Therefore any modification you make to the returned list will be present inside the JAXB object. This is why there is not a `set` method for the actions property.

For example, to add a new item, do as follows:

```
getActions ().add(newItem);
```

Objects of the following type(s) are allowed in the list [Actions](#)

[Actor](#) [getActor](#) ()

Gets the value of the actor property.

Returns:

possible object is [Actor](#)

void [setActor](#) ([Actor](#) value)

Sets the value of the actor property.

Parameters:

<i>value</i>	allowed object is Actor
--------------	---

WebAttributes Class Reference

Public Member Functions

- java.util.List< [Actions](#) > [getActions](#) ()
 - [Actor](#) [getActor](#) ()
 - void [setActor](#) ([Actor](#) value)
-

Detailed Description

WebAttributes Schema

This schema has the definition of [WebAttributes](#).

XML Schema File

model/v12/xsd/interaction/activity.xsd

Name	Description	Type
actor	This has the details of whose actions created the activity.	Actor
actions	This has the details of the actions performed by the actor.	Actions

Member Function Documentation

java.util.List<[Actions](#)> [getActions](#) ()

Gets the value of the actions property.

This accessor method returns a reference to the live list, not a snapshot. Therefore any modification you make to the returned list will be present inside the JAXB object. This is why there is not a `set` method for the actions property.

For example, to add a new item, do as follows:

```
getActions ().add(newItem);
```

Objects of the following type(s) are allowed in the list [Actions](#)

[Actor](#) [getActor](#) ()

Gets the value of the actor property.

Returns:

possible object is [Actor](#)

void [setActor](#) ([Actor](#) value)

Sets the value of the actor property.

Parameters:

<i>value</i>	allowed object is Actor
--------------	---

Website Class Reference

Public Member Functions

- long [getId](#) ()
 - [DateAndUser](#) [getLastModified](#) ()
 - java.lang.String [getUrl](#) ()
 - [L10NString](#) [getWebsiteType](#) ()
 - void [setId](#) (long value)
 - void [setLastModified](#) ([DateAndUser](#) value)
 - void [setUrl](#) (java.lang.String value)
 - void [setWebsiteType](#) ([L10NString](#) value)
-

Detailed Description

Website Schema

Definition of [Website](#) contact point schema.

XML Schema File

model/v15/xsd/interaction/contact_point.xsd

Name	Description	Type
id	contact point ID	Long
url	URL of the website contact point	String
websiteType	type of website of website contact point	L10NString
lastModified	Last modification details of the contact point	DateAndUser

Member Function Documentation

long [getId](#) ()

Gets the value of the id property.

Returns:

possible object is [Long](#)

[DateAndUser](#) [getLastModified](#) ()

Gets the value of the lastModified property.

Returns:

possible object is [DateAndUser](#)

java.lang.String getUrl ()

Gets the value of the url property.

Returns:

possible object is [java.lang.String](#)

[L10NString](#) getWebsiteType ()

Gets the value of the websiteType property.

Returns:

possible object is [L10NString](#)

void setId (long value)

Sets the value of the id property.

Parameters:

<i>value</i>	allowed object is Long
--------------	--

void setLastModified ([DateAndUser](#) value)

Sets the value of the lastModified property.

Parameters:

<i>value</i>	allowed object is DateAndUser
--------------	---

void setUrl (java.lang.String value)

Sets the value of the url property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setWebsiteType ([L10NString](#) value)

Sets the value of the websiteType property.

Parameters:

<i>value</i>	allowed object is L10NString
--------------	--

Website Class Reference

Public Member Functions

- long [getId](#) ()
 - [DateAndUser](#) [getLastModified](#) ()
 - java.lang.String [getUrl](#) ()
 - [L10NString](#) [getWebsiteType](#) ()

 - void [setUrl](#) (java.lang.String value)
 - void [setWebsiteType](#) ([L10NString](#) value)
-

Detailed Description

Website Schema

Definition of [Website](#) contact point schema.

XML Schema File

model/v12/xsd/interaction/contact_point.xsd

Name	Description	Type
id	contact point ID	Long
url	URL of the website contact point	String
websiteType	Type of website of website contact point	L10NString
lastModified	Last modification details of the contact point	DateAndUser

Member Function Documentation

long [getId](#) ()

Gets the value of the id property.

Returns:

possible object is [Long](#)

[DateAndUser](#) [getLastModified](#) ()

Gets the value of the lastModified property.

Returns:

possible object is [DateAndUser](#)

java.lang.String getUrl ()

Gets the value of the url property.

Returns:

possible object is [java.lang.String](#)

[L10NString](#) getWebsiteType ()

Gets the value of the websiteType property.

Returns:

possible object is [L10NString](#)

void setId (long value)

Sets the value of the id property.

Parameters:

<i>value</i>	allowed object is Long
--------------	--

void setLastModified ([DateAndUser](#) value)

Sets the value of the lastModified property.

Parameters:

<i>value</i>	allowed object is DateAndUser
--------------	---

void setUrl (java.lang.String value)

Sets the value of the url property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setWebsiteType ([L10NString](#) value)

Sets the value of the websiteType property.

Parameters:

<i>value</i>	allowed object is L10NString
--------------	--

Writer Class Reference

Public Member Functions

- java.lang.String [getId](#) ()
 - java.lang.String [getName](#) ()
 - void [setId](#) (java.lang.String value)
 - void [setName](#) (java.lang.String value)
-

Detailed Description

Documentation to be added when the Authoring API is released.

Member Function Documentation

java.lang.String getId ()

Gets the value of the id property.

Returns:

possible object is [java.lang.String](#)

java.lang.String getName ()

Gets the value of the name property.

Returns:

possible object is [java.lang.String](#)

void setId (java.lang.String value)

Sets the value of the id property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setName (java.lang.String value)

Sets the value of the name property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

WSError Class Reference

Public Member Functions

- java.lang.String [getCode](#) ()
 - java.lang.String [getDeveloperMessage](#) ()
 - void [setCode](#) (java.lang.String value)
 - void [setDeveloperMessage](#) (java.lang.String value)
-

Detailed Description

Error

Web Service error response schema.

XML Schema File

model/v12/xsd/common/ws_error.xsd

Name	Description	Type
code	WS error code	String
developerMessage	Error message intended for use by developer (API consumer)	String

Member Function Documentation

java.lang.String [getCode](#) ()

Gets the value of the code property.

Returns:

possible object is [java.lang.String](#)

java.lang.String [getDeveloperMessage](#) ()

Gets the value of the developerMessage property.

Returns:

possible object is [java.lang.String](#)

void [setCode](#) (java.lang.String *value*)

Sets the value of the code property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void [setDeveloperMessage](#) (java.lang.String *value*)

Sets the value of the developerMessage property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

WSError Class Reference

 - void [setIdpLoginURL](#) (java.lang.String value)
 - void [setProviders](#) ([Providers](#) value)
 - void [setSamlRequest](#) (java.lang.String value)
-

Detailed Description

Error

Web Service error response schema.

XML Schema File

model/v15/xsd/common/ws_error.xsd

Name	Description	Type
code	WS error code	String
developerMessage	Error message intended for use by developer (API consumer)	String
idpLoginURL	Identity provider login URL (reserved for specific use cases and not commonly returned)	String
samlRequest	SAML request token (reserved for specific use cases and not commonly returned)	String
providers	Details of configured providers in the application.	Providers

Member Function Documentation

java.lang.String [getCode](#) ()

Gets the value of the code property.

Returns:

possible object is [java.lang.String](#)

java.lang.String getDeveloperMessage ()

Gets the value of the developerMessage property.

Returns:

possible object is [java.lang.String](#)

java.lang.String getIdpLoginURL ()

Gets the value of the idpLoginURL property.

Returns:

possible object is [java.lang.String](#)

[Providers](#) getProviders ()

Gets the value of the providers property.

Returns:

possible object is [Providers](#)

java.lang.String getSamlRequest ()

Gets the value of the samlRequest property.

Returns:

possible object is [java.lang.String](#)

void setCode (java.lang.String value)

Sets the value of the code property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setDeveloperMessage (java.lang.String value)

Sets the value of the developerMessage property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setIdpLoginURL (java.lang.String value)

Sets the value of the idpLoginURL property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setProviders ([Providers](#) value)

Sets the value of the providers property.

Parameters:

<i>value</i>	allowed object is Providers
--------------	---

void setSamlRequest (java.lang.String value)

Sets the value of the samlRequest property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

WSObject Class Reference

Public Member Functions

- java.lang.String [getCustomization](#) ()
 - long [getId](#) ()
 - [Link](#) [getLink](#) ()
 - void [setCustomization](#) (java.lang.String value)
 - void [setId](#) (long value)
 - void [setLink](#) ([Link](#) value)
-

Detailed Description

WSObject Schema

This schema is the base class of the result object types, such as schema-ss-Article.

XML Schema File

model/v3/xsd/common.xsd

Name	Description	Type	Included?
id	The ID of the object, if it has one.	long	Optional
link	If the attribute <code>rel=self</code> , this contains a REST URL that retrieves this item.	Link	Always

Member Function Documentation

java.lang.String [getCustomization](#) ()

Gets the value of the customization property.

Returns:

possible object is [java.lang.String](#)

long [getId](#) ()

Gets the value of the id property.

Returns:

possible object is [Long](#)

[Link](#) [getLink](#) ()

Gets the value of the link property.

Returns:

possible object is [Link](#)

void setCustomization (java.lang.String value)

Sets the value of the customization property.

Parameters:

<i>value</i>	allowed object is java.lang.String
--------------	--

void setId (long value)

Sets the value of the id property.

Parameters:

<i>value</i>	allowed object is Long
--------------	--

void setLink ([Link](#) value)

Sets the value of the link property.

Parameters:

<i>value</i>	allowed object is Link
--------------	--

WSResult Class Reference

Public Member Functions

- [CallInfo](#) [getCallInfo](#) ()
 - [Deployment](#) [getDeploymentInfo](#) ()
 - java.util.List< [Link](#) > [getLink](#) ()
 - [Paging](#) [getPagingInfo](#) ()
 - void [setCallInfo](#) ([CallInfo](#) value)
 - void [setDeploymentInfo](#) ([Deployment](#) value)
 - void [setPagingInfo](#) ([Paging](#) value)
-

Detailed Description

WSResult Schema

This schema is the base class of all result schemas.

XML Schema File

model/v3/xsd/common.xsd

Name	Description	Type
link	If the attribute rel=self , this contains a REST URL that recreates the current call.rel=prev or rel=next , the URL refers to the previous or next page of results.	Link
callInfo	Meta information about the call.	CallInfo
pagingInfo	Information about paging of results.	Paging
deploymentInfo	Information about Website Deployment .	Deployment

Member Function Documentation

[CallInfo](#) [getCallInfo](#) ()

Gets the value of the callInfo property.

Returns:

possible object is [CallInfo](#)

[Deployment](#) getDeploymentInfo ()

Gets the value of the deploymentInfo property.

Returns:

possible object is [Deployment](#)

java.util.List<[Link](#)> getLink ()

Gets the value of the link property.

This accessor method returns a reference to the live list, not a snapshot. Therefore any modification you make to the returned list will be present inside the JAXB object. This is why there is not a `set` method for the link property.

For example, to add a new item, do as follows:

```
getLink().add(newItem);
```

Objects of the following type(s) are allowed in the list [Link](#)

[Paging](#) getPagingInfo ()

Gets the value of the pagingInfo property.

Returns:

possible object is [Paging](#)

void setCallInfo ([CallInfo](#) value)

Sets the value of the callInfo property.

Parameters:

<i>value</i>	allowed object is CallInfo
--------------	--

void setDeploymentInfo ([Deployment](#) value)

Sets the value of the deploymentInfo property.

Parameters:

<i>value</i>	allowed object is Deployment
--------------	--

void setPagingInfo ([Paging](#) value)

Sets the value of the pagingInfo property.

Parameters:

<i>value</i>	allowed object is Paging
--------------	--

XMLExampleNoBodyRequestHeadersSection Class Reference

Detailed Description

Request headers

Name	Value
X-egain-session	Valid session ID
Accept	application/xml
Accept-Language	en-US

XsdDatatypeDefinitions Class Reference

Detailed Description

XSD Datatype Definition

Overview

This page lists the data types that are used in the xsds.

Datatype definitions

Name	Description
String	A string representation.
Long	This is a numeric representation with maximum value of 9223372036854775807 and minimum value of -9223372036854775808.
Int	This is a numeric representation with maximum value of 2147483647 and minimum value of -2147483648.
Boolean	This is a boolean representation, which can have either true or false as value.
DateTime	This is a date and time representation. Unless explicitly specified, UTC value is returned. The format is "YYYY-MM-DDThh:mm:ss.sssZ". Eg: 2002-05-30T09:00:00.000Z
